1.4.2 Repository	139
1.4.3 Entity-Attribute-Value (EAV)	148

This is a collection of known design patterns and some sample code how to implement them in PHP. Every pattern has a small list of examples.

I think the problem with patterns is that often people do know them but don't know when to apply which.

PATTERNS

The patterns can be structured in roughly three different categories. Please click on [the title of every pattern's page](#) for a full explanation of the pattern on Wikipedia.

1.1 Creational

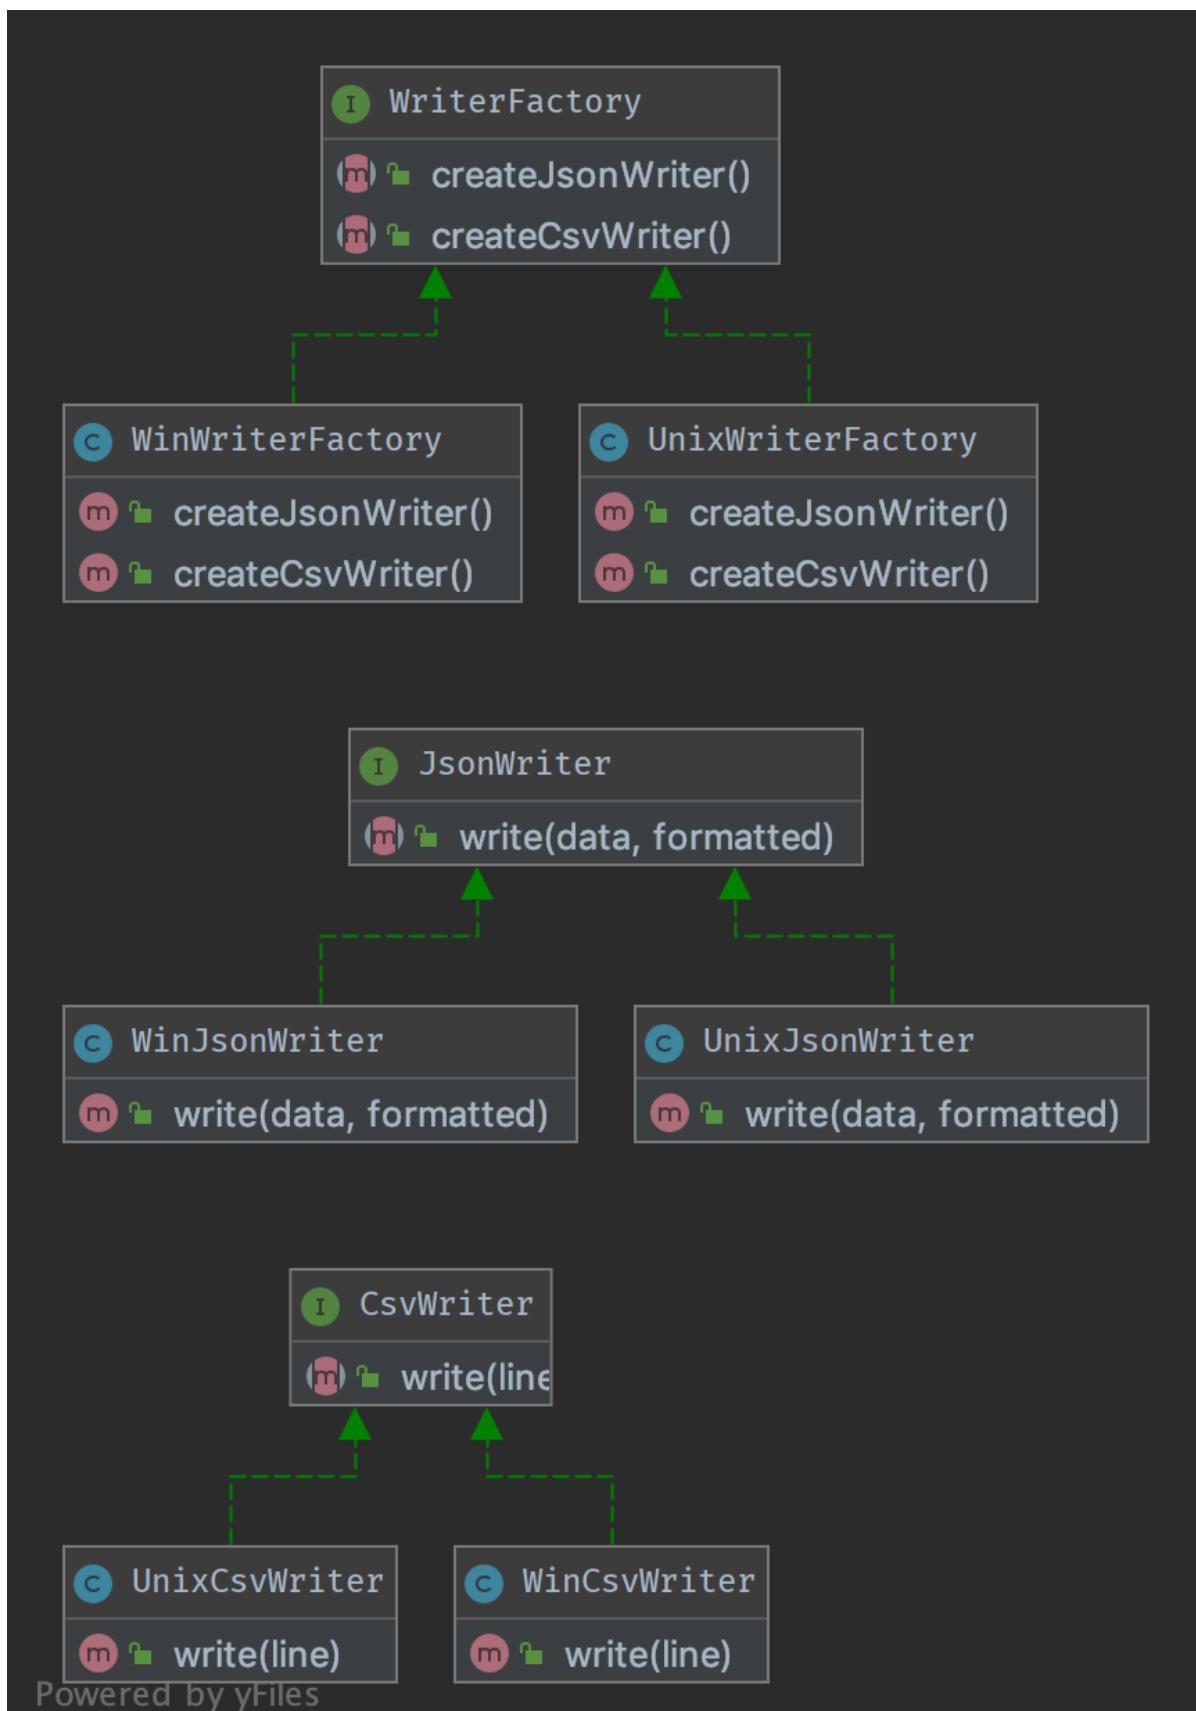

In software engineering, creational design patterns are design patterns that deal with object creation mechanisms, trying to create objects in a manner suitable to the situation. The basic form of object creation could result in design problems or added complexity to the design. Creational design patterns solve this problem by somehow controlling this object creation.

1.1.1 Abstract Factory

Purpose

To create series of related or dependent objects without specifying their concrete classes. Usually the created classes all implement the same interface. The client of the abstract factory does not care about how these objects are created, it just knows how they go together.

WriterFactory.php

```
1 <?php
2
3 namespace DesignPatterns\Creational\AbstractFactory;
4
5 interface WriterFactory
6 {
7     public function createCsvWriter(): CsvWriter;
8     public function createJsonWriter(): JsonWriter;
9 }
```

CsvWriter.php

```
1 <?php
2
3 namespace DesignPatterns\Creational\AbstractFactory;
4
5 interface CsvWriter
6 {
7     public function write(array $line): string;
8 }
```

JsonWriter.php

```
1 <?php
2
3 namespace DesignPatterns\Creational\AbstractFactory;
4
5 interface JsonWriter
6 {
7     public function write(array $data, bool $formatted): string;
8 }
```

UnixCsvWriter.php

```
1 <?php
2
3 namespace DesignPatterns\Creational\AbstractFactory;
4
5 class UnixCsvWriter implements CsvWriter
6 {
7     public function write(array $line): string
8     {
9         return join(',', $line) . "\n";
10    }
11 }
```

UnixJsonWriter.php

```

1 <?php
2
3 namespace DesignPatterns\Creational\AbstractFactory;
4
5 class UnixJsonWriter implements JsonWriter
6 {
7     public function write(array $data, bool $formatted): string
8     {
9         $options = 0;
10
11         if ($formatted) {
12             $options = JSON_PRETTY_PRINT;
13         }
14
15         return json_encode($data, $options);
16     }
17 }
```

UnixWriterFactory.php

```

1 <?php
2
3 namespace DesignPatterns\Creational\AbstractFactory;
4
5 class UnixWriterFactory implements WriterFactory
6 {
7     public function createCsvWriter(): CsvWriter
8     {
9         return new UnixCsvWriter();
10    }
11
12    public function createJsonWriter(): JsonWriter
13    {
14        return new UnixJsonWriter();
15    }
16 }
```

WinCsvWriter.php

```

1 <?php
2
3 namespace DesignPatterns\Creational\AbstractFactory;
4
5 class WinCsvWriter implements CsvWriter
6 {
7     public function write(array $line): string
8     {
9         return join(',', $line) . "\r\n";
10    }
11 }
```

WinJsonWriter.php

```
1 <?php
2
3 namespace DesignPatterns\Creational\AbstractFactory;
4
5 class WinJsonWriter implements JsonWriter
6 {
7     public function write(array $data, bool $formatted): string
8     {
9         $options = 0;
10
11         if ($formatted) {
12             $options = JSON_PRETTY_PRINT;
13         }
14
15         return json_encode($data, $options);
16     }
17 }
```

WinWriterFactory.php

```
1 <?php
2
3 namespace DesignPatterns\Creational\AbstractFactory;
4
5 class WinWriterFactory implements WriterFactory
6 {
7     public function createCsvWriter(): CsvWriter
8     {
9         return new WinCsvWriter();
10    }
11
12    public function createJsonWriter(): JsonWriter
13    {
14        return new WinJsonWriter();
15    }
16 }
```

Test

Tests/AbstractFactoryTest.php

```
1 <?php
2
3 declare(strict_types=1);
4
5 namespace DesignPatterns\Creational\AbstractFactory\Tests;
6
7 use DesignPatterns\Creational\AbstractFactory\CsvWriter;

9 use DesignPatterns\Creational\AbstractFactory\UnixWriterFactory;
10 use DesignPatterns\Creational\AbstractFactory\WinWriterFactory;
11 use DesignPatterns\Creational\AbstractFactory\WriterFactory;
```

(continues on next page)

(continued from previous page)

```

12 use PHPUnit\Framework\TestCase;
13
14 class AbstractFactoryTest extends TestCase
15 {
16     public function provideFactory()
17     {
18         return [
19             [new UnixWriterFactory()],
20             [new WinWriterFactory()]
21         ];
22     }
23
24 /**
25 * @dataProvider provideFactory
26 */
27 public function testCanCreateCsvWriterOnUnix(WriterFactory $writerFactory)
28 {
29     $this->assertInstanceOf(JsonWriter::class, $writerFactory->createJsonWriter());
30     $this->assertInstanceOf(CsvWriter::class, $writerFactory->createCsvWriter());
31 }
32 }
```

1.1.2 Builder

Purpose

Builder is an interface that build parts of a complex object.

Sometimes, if the builder has a better knowledge of what it builds, this interface could be an abstract class with default methods (aka adapter).

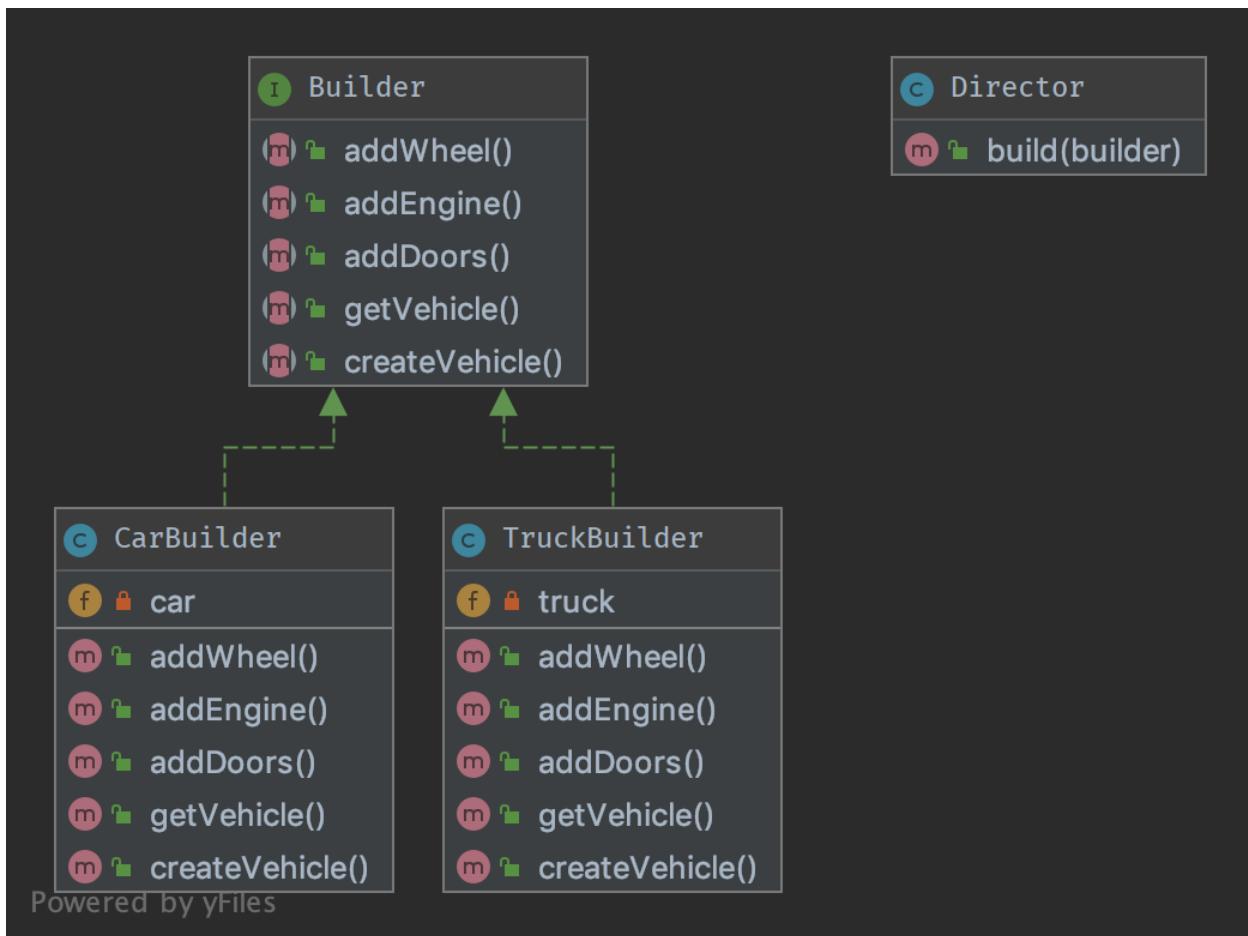

If you have a complex inheritance tree for objects, it is logical to have a complex inheritance tree for builders too.

Note: Builders have often a fluent interface, see the mock builder of PHPUnit for example.

Examples

- PHPUnit: Mock Builder

30     }
31 }
```

1.1.3 Factory Method

Purpose

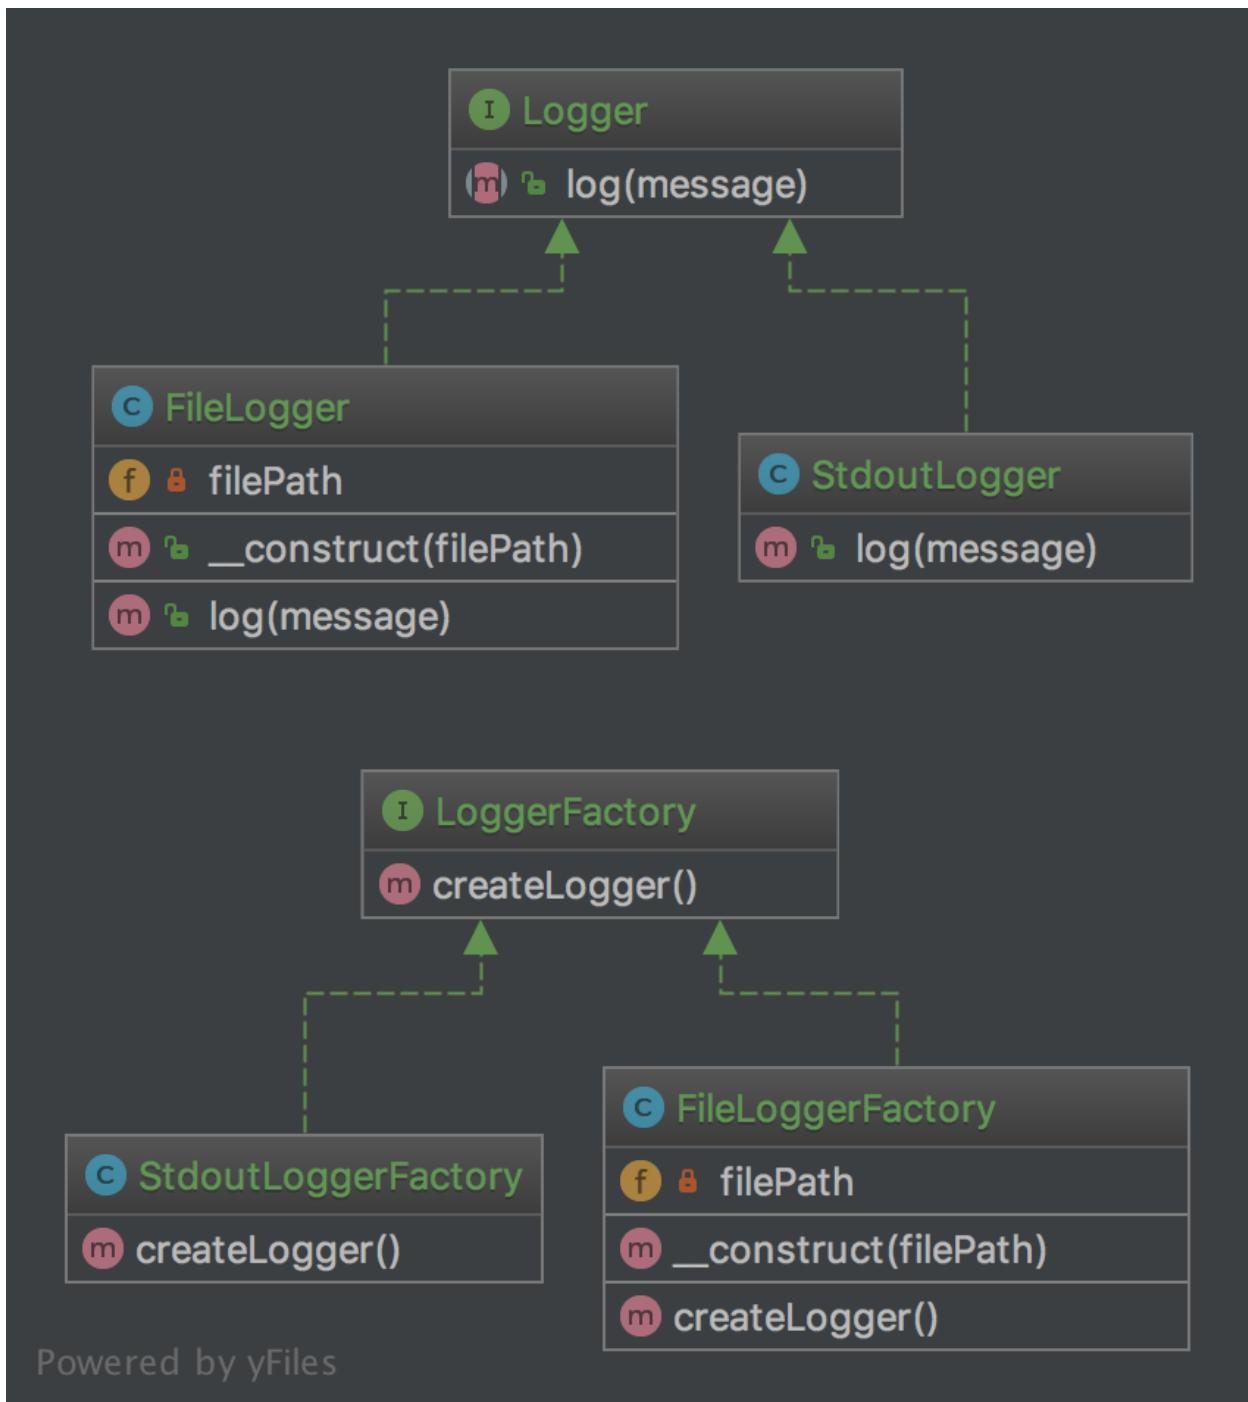

The good point over the SimpleFactory is you can subclass it to implement different ways to create objects.

For simple cases, this abstract class could be just an interface.

This pattern is a “real” Design Pattern because it achieves the Dependency Inversion principle a.k.a the “D” in SOLID principles.

It means the FactoryMethod class depends on abstractions, not concrete classes. This is the real trick compared to SimpleFactory or StaticFactory.

27
28         $this->assertInstanceOf(FileLogger::class, $logger);
29     }
30 }
```

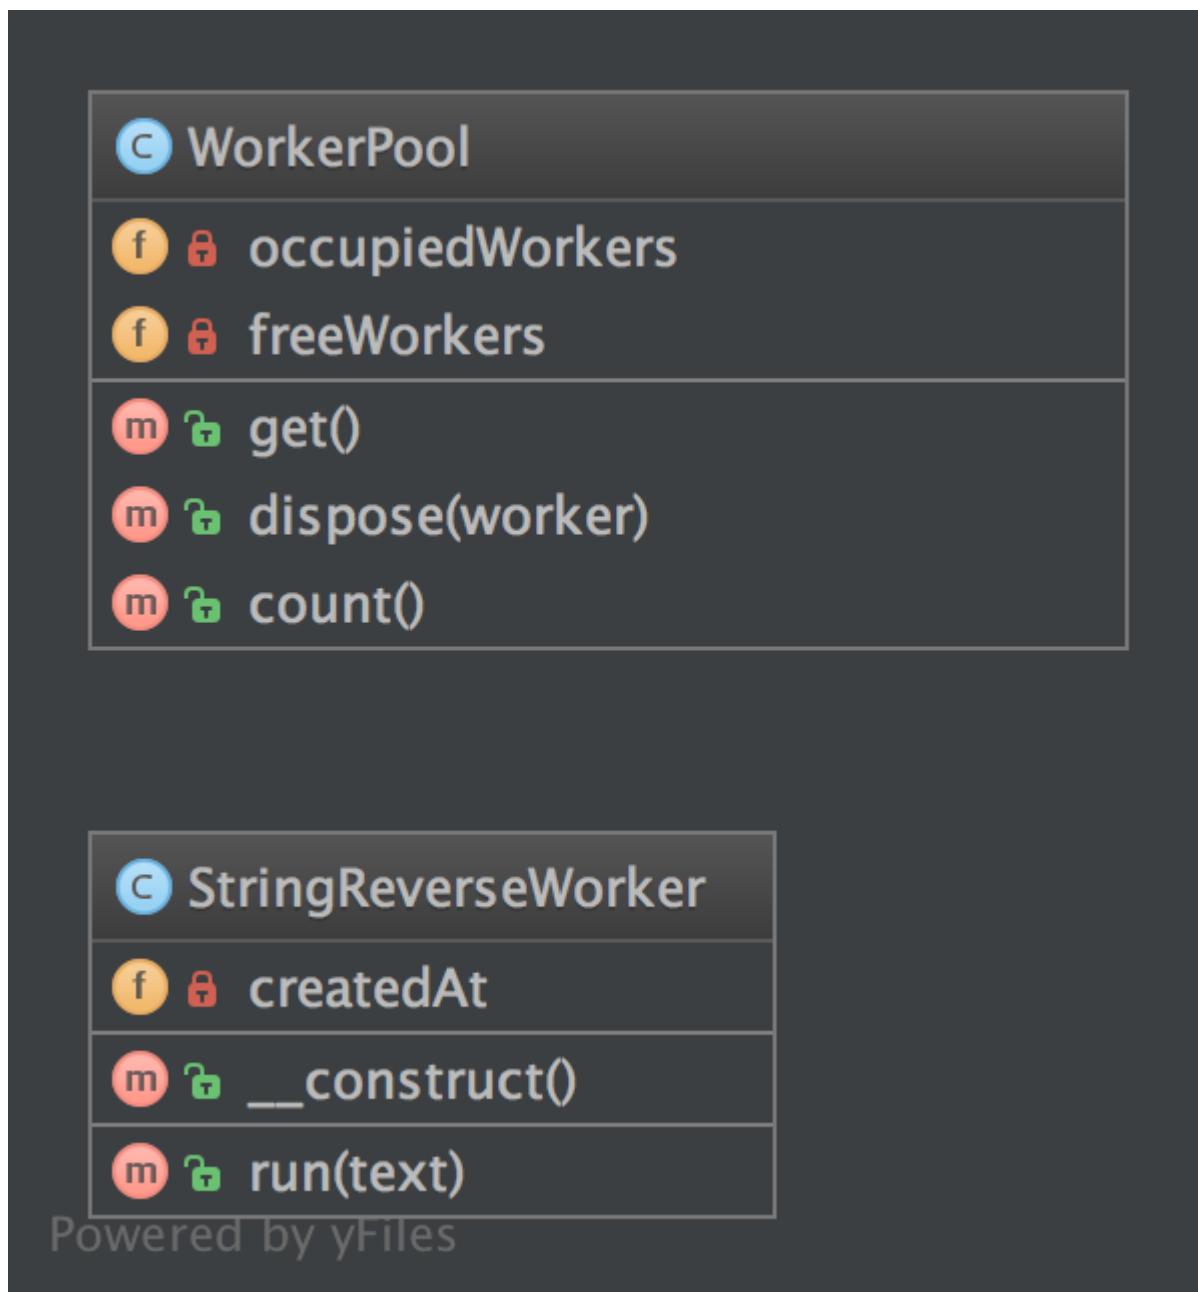

1.1.4 Pool

Purpose

The **object pool pattern** is a software creational design pattern that uses a set of initialized objects kept ready to use – a “pool” – rather than allocating and destroying them on demand. A client of the pool will request an object from the pool and perform operations on the returned object. When the client has finished, it returns the object, which is a specific type of factory object, to the pool rather than destroying it.

Object pooling can offer a significant performance boost in situations where the cost of initializing a class instance is high, the rate of instantiation of a class is high, and the number of instances in use at any one time is low. The pooled object is obtained in predictable time when creation of the new objects (especially over network) may take variable time.

However these benefits are mostly true for objects that are expensive with respect to time, such as database connections, socket connections, threads and large graphic objects like fonts or bitmaps. In certain situations, simple object pooling (that hold no external resources, but only occupy memory) may not be efficient and could decrease performance.

20     }
21
22     public function testCanGetSameInstanceTwiceWhenDisposingItFirst()
23     {
24         $pool = new WorkerPool();
25         $worker1 = $pool->get();
26         $pool->dispose($worker1);
27         $worker2 = $pool->get();
28
29         $this->assertCount(1, $pool);
30         $this->assertSame($worker1, $worker2);
31     }
32 }
```

1.1.5 Prototype

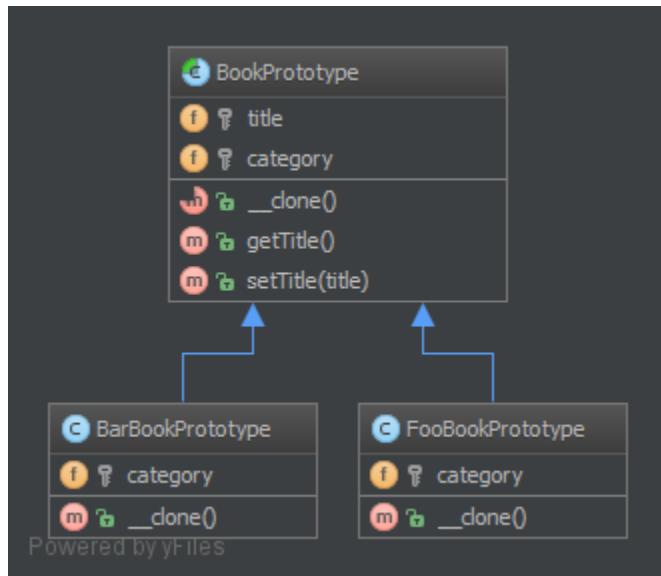

Purpose

To avoid the cost of creating objects the standard way (`new Foo()`) and instead create a prototype and clone it.

Examples

- Large amounts of data (e.g. create 1,000,000 rows in a database at once via a ORM).

UML Diagram

Code

You can also find this code on [GitHub](#)

`BookPrototype.php`

```

1 <?php
2
3 declare(strict_types=1);
4
5 namespace DesignPatterns\Creational\Prototype;
6
7 abstract class BookPrototype
8 {
9     protected string $title;
10    protected string $category;
11
12    abstract public function __clone();
13
14    final public function getTitle(): string
  
```

(continues on next page)

(continued from previous page)

```
15     {
16         return $this->title;
17     }
18
19     final public function setTitle(string $title): void
20     {
21         $this->title = $title;
22     }
23 }
```

BarBookPrototype.php

```
1 <?php
2
3 declare(strict_types=1);
4
5 namespace DesignPatterns\Creational\Prototype;
6
7 class BarBookPrototype extends BookPrototype
8 {
9     protected string $category = 'Bar';
10
11    public function __clone()
12    {
13    }
14 }
```

FooBookPrototype.php

```
1 <?php
2
3 declare(strict_types=1);
4
5 namespace DesignPatterns\Creational\Prototype;
6
7 class FooBookPrototype extends BookPrototype
8 {
9     protected string $category = 'Foo';
10
11    public function __clone()
12    {
13    }
14 }
```

Test

Tests/PrototypeTest.php

```

1 <?php
2
3 declare(strict_types=1);
4
5 namespace DesignPatterns\Creational\Prototype\Tests;
6
7 use DesignPatterns\Creational\Prototype\BarBookPrototype;
8 use DesignPatterns\Creational\Prototype\FooBookPrototype;
9 use PHPUnit\Framework\TestCase;
10
11 class PrototypeTest extends TestCase
12 {
13     public function testCanGetFooBook()
14     {
15         $fooPrototype = new FooBookPrototype();
16         $barPrototype = new BarBookPrototype();
17
18         for ($i = 0; $i < 10; $i++) {
19             $book = clone $fooPrototype;
20             $book->setTitle('Foo Book No ' . $i);
21             $this->assertInstanceOf(FooBookPrototype::class, $book);
22         }
23
24         for ($i = 0; $i < 5; $i++) {
25             $book = clone $barPrototype;
26             $book->setTitle('Bar Book No ' . $i);
27             $this->assertInstanceOf(BarBookPrototype::class, $book);
28         }
29     }
30 }
```

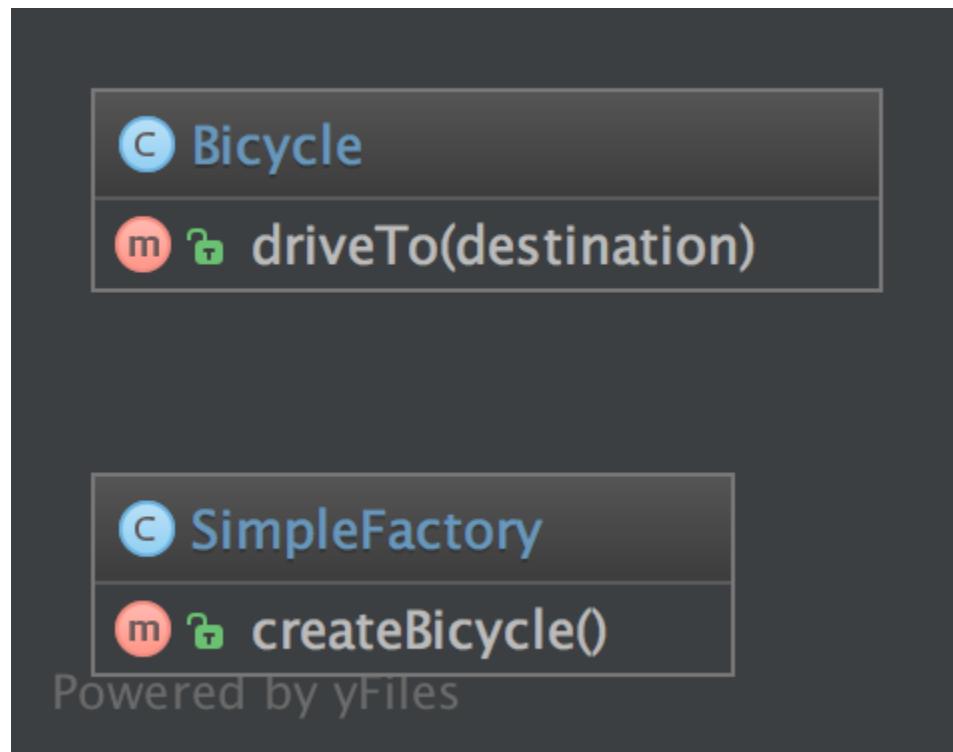

1.1.6 Simple Factory

Purpose

SimpleFactory is a simple factory pattern.

It differs from the static factory because it is not static. Therefore, you can have multiple factories, differently parameterized, you can subclass it and you can mock it. It always should be preferred over a static factory!

UML Diagram

Code

You can also find this code on [GitHub](#)

SimpleFactory.php

```
1 <?php
2
3 declare(strict_types=1);
4
5 namespace DesignPatterns\Creational\SimpleFactory;
6
7 class SimpleFactory
8 {
9     public function createBicycle(): Bicycle
10    {
11        return new Bicycle();
12    }
13 }
```

Bicycle.php

```
1 <?php
2
3 declare(strict_types=1);
4
```

(continues on next page)

(continued from previous page)

```

5 namespace DesignPatterns\Creational\SimpleFactory;
6
7 class Bicycle
8 {
9     public function driveTo(string $destination)
10    {
11    }
12 }

```

Usage

```

1 $factory = new SimpleFactory();
2 $bicycle = $factory->createBicycle();
3 $bicycle->driveTo('Paris');

```

Test

Tests/SimpleFactoryTest.php

```

1 <?php
2
3 declare(strict_types=1);
4
5 namespace DesignPatterns\Creational\SimpleFactory\Tests;
6
7 use DesignPatterns\Creational\SimpleFactory\Bicycle;
8 use DesignPatterns\Creational\SimpleFactory\SimpleFactory;
9 use PHPUnit\Framework\TestCase;
10
11 class SimpleFactoryTest extends TestCase
12 {
13     public function testCanCreateBicycle()
14     {
15         $bicycle = (new SimpleFactory())->createBicycle();
16         $this->assertInstanceOf(Bicycle::class, $bicycle);
17     }
18 }

```

1.1.7 Singleton

THIS IS CONSIDERED TO BE AN ANTI-PATTERN! FOR BETTER TESTABILITY AND MAINTAINABILITY USE DEPENDENCY INJECTION!

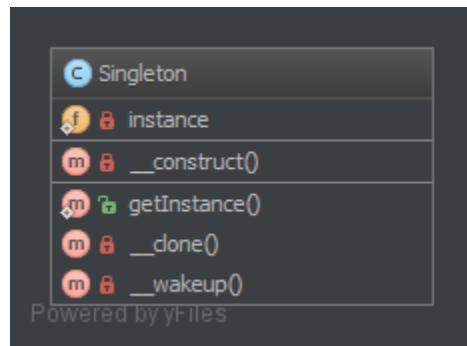

Purpose

To have only one instance of this object in the application that will handle all calls.

Examples

- DB Connector
- Logger
- Config Manager
- Threads Handling
- Lock file for the application (there is only one in the filesystem ...)

UML Diagram

Code

You can also find this code on [GitHub](#)

Singleton.php

```

1 <?php
2
3 declare(strict_types=1);
4
5 namespace DesignPatterns\Creational\Singleton;
6
7 use Exception;
8
9 final class Singleton
10 {
11     private static ?Singleton $instance = null;
12
13     /**
14      * gets the instance via lazy initialization (created on first usage)
15      */
16     public static function getInstance(): Singleton
17     {
18         if (self::$instance === null) {
  
```

(continues on next page)

(continued from previous page)

```

19         self::$instance = new self();
20     }
21
22     return self::$instance;
23 }
24
25 /**
26 * is not allowed to call from outside to prevent from creating multiple instances,
27 * to use the singleton, you have to obtain the instance from
28 → Singleton::getInstance() instead
29 */
30
31 private function __construct()
32 {
33 }
34
35 /**
36 * prevent the instance from being cloned (which would create a second instance of
37 → it)
38 */
39
40 private function __clone()
41 {
42 }
43
44 /**
45 * prevent from being unserialized (which would create a second instance of it)
46 */
47 public function __wakeup()
48 {
49     throw new Exception("Cannot unserialize singleton");
50 }
51
52 }
```

Test

Tests/SingletonTest.php

```

1 <?php
2
3 declare(strict_types=1);
4
5 namespace DesignPatterns\Creational\Singleton\Tests;
6
7 use DesignPatterns\Creational\Singleton\Singleton;
8 use PHPUnit\Framework\TestCase;
9
10 class SingletonTest extends TestCase
11 {
12     public function testUniqueness()
13     {
14         $firstCall = Singleton::getInstance();
15         $secondCall = Singleton::getInstance();
```

(continues on next page)

(continued from previous page)

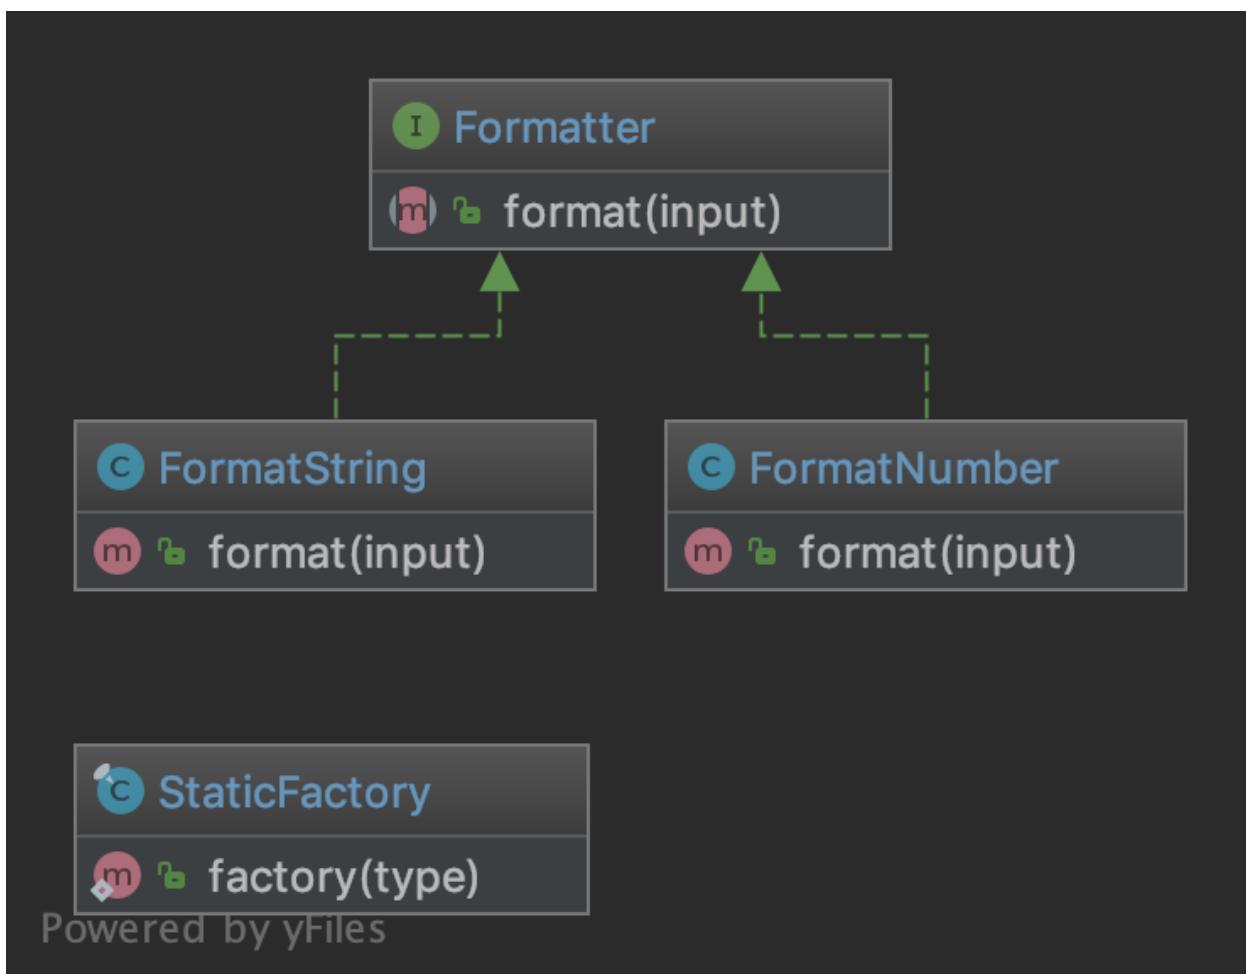

```
16     $this->assertInstanceOf(Singleton::class, $firstCall);
17     $this->assertSame($firstCall, $secondCall);
18 }
19 }
20 }
```

1.1.8 Static Factory

Purpose

Similar to the AbstractFactory, this pattern is used to create series of related or dependent objects. The difference between this and the abstract factory pattern is that the static factory pattern uses just one static method to create all types of objects it can create. It is usually named `factory` or `build`.

UML Diagram

Code

10 use DesignPatterns\Creational\StaticFactory\StaticFactory;
11 use PHPUnit\Framework\TestCase;
12
13 class StaticFactoryTest extends TestCase
14 {
15     public function testCanCreateNumberFormatter()
16     {
17         $this->assertInstanceOf(FormatNumber::class, StaticFactory::factory('number'));
18     }
19
20     public function testCanCreateStringFormatter()
21     {
22         $this->assertInstanceOf(FormatString::class, StaticFactory::factory('string'));
23     }
24
25     public function testException()
26     {
27         $this->expectException(InvalidArgumentException::class);
28         StaticFactory::factory('invalid');
29     }
30 }
```

(continues on next page)

(continued from previous page)

```
26     {
27         $this->expectException(InvalidArgumentException::class);
28
29         StaticFactory::factory('object');
30     }
31 }
```

1.2 Structural

In Software Engineering, Structural Design Patterns are Design Patterns that ease the design by identifying a simple way to realize relationships between entities.

1.2.1 Adapter / Wrapper

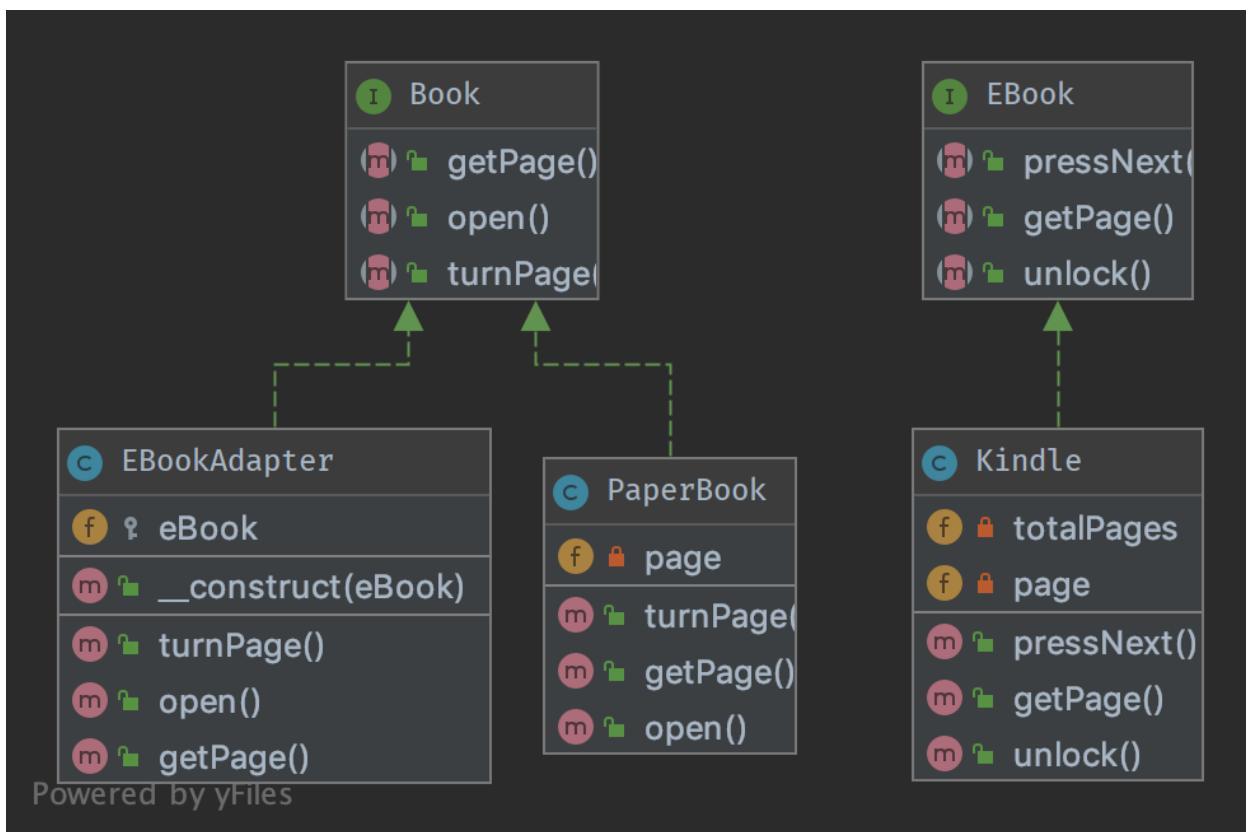

Purpose

To translate one interface for a class into a compatible interface. An adapter allows classes to work together that normally could not because of incompatible interfaces by providing its interface to clients while using the original interface.

Examples

- DB Client libraries adapter
- using multiple different webservices and adapters normalize data so that the outcome is the same for all

9     public function get(): string
10    {
11        return $this->implementation->format('pong');
12    }
13 }
```

Test

Tests/BridgeTest.php

```
1 <?php
2
3 declare(strict_types=1);
4
5 namespace DesignPatterns\Structural\Bridge\Tests;
6
7 use DesignPatterns\Structural\Bridge\HelloWorldService;
8 use DesignPatterns\Structural\Bridge\HtmlFormatter;
9 use DesignPatterns\Structural\Bridge\PlainTextFormatter;
10 use PHPUnit\Framework\TestCase;
11
12 class BridgeTest extends TestCase
13 {
14     public function testCanPrintUsingThePlainTextFormatter()
15     {
16         $service = new HelloWorldService(new PlainTextFormatter());
17
18         $this->assertSame('Hello World', $service->get());
19     }
20
21     public function testCanPrintUsingTheHtmlFormatter()
22     {
23         $service = new HelloWorldService(new HtmlFormatter());
24
25         $this->assertSame('<p>Hello World</p>', $service->get());
26     }
27 }
```

1.2.3 Composite

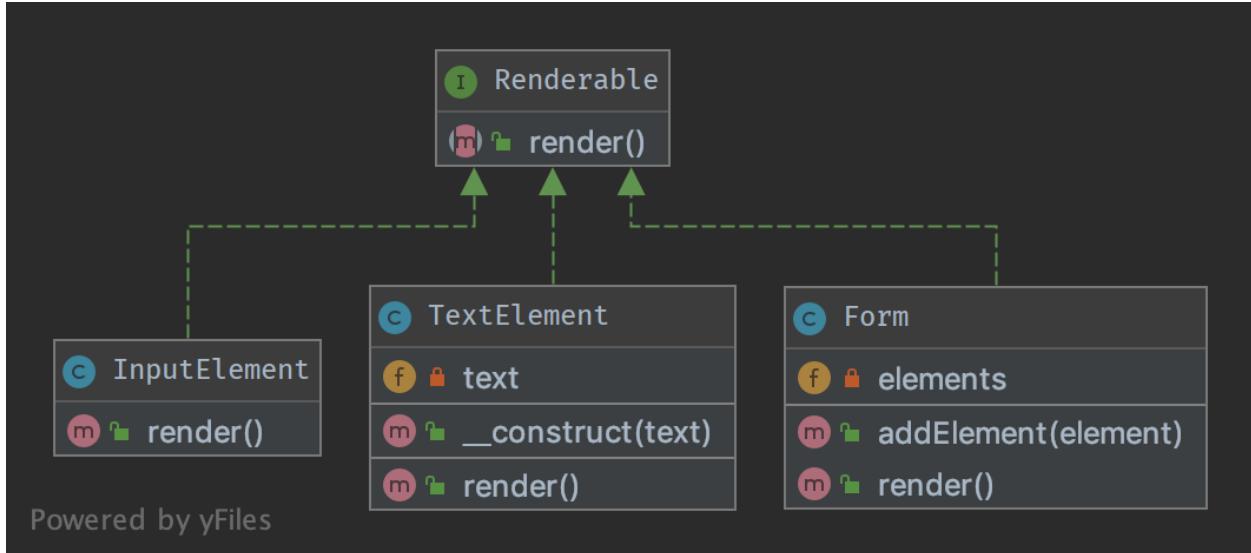

Purpose

To treat a group of objects the same way as a single instance of the object.

Examples

- a form class instance handles all its form elements like a single instance of the form, when `render()` is called, it subsequently runs through all its child elements and calls `render()` on them

UML Diagram

Code

```

1.2.4 Data Mapper

Purpose

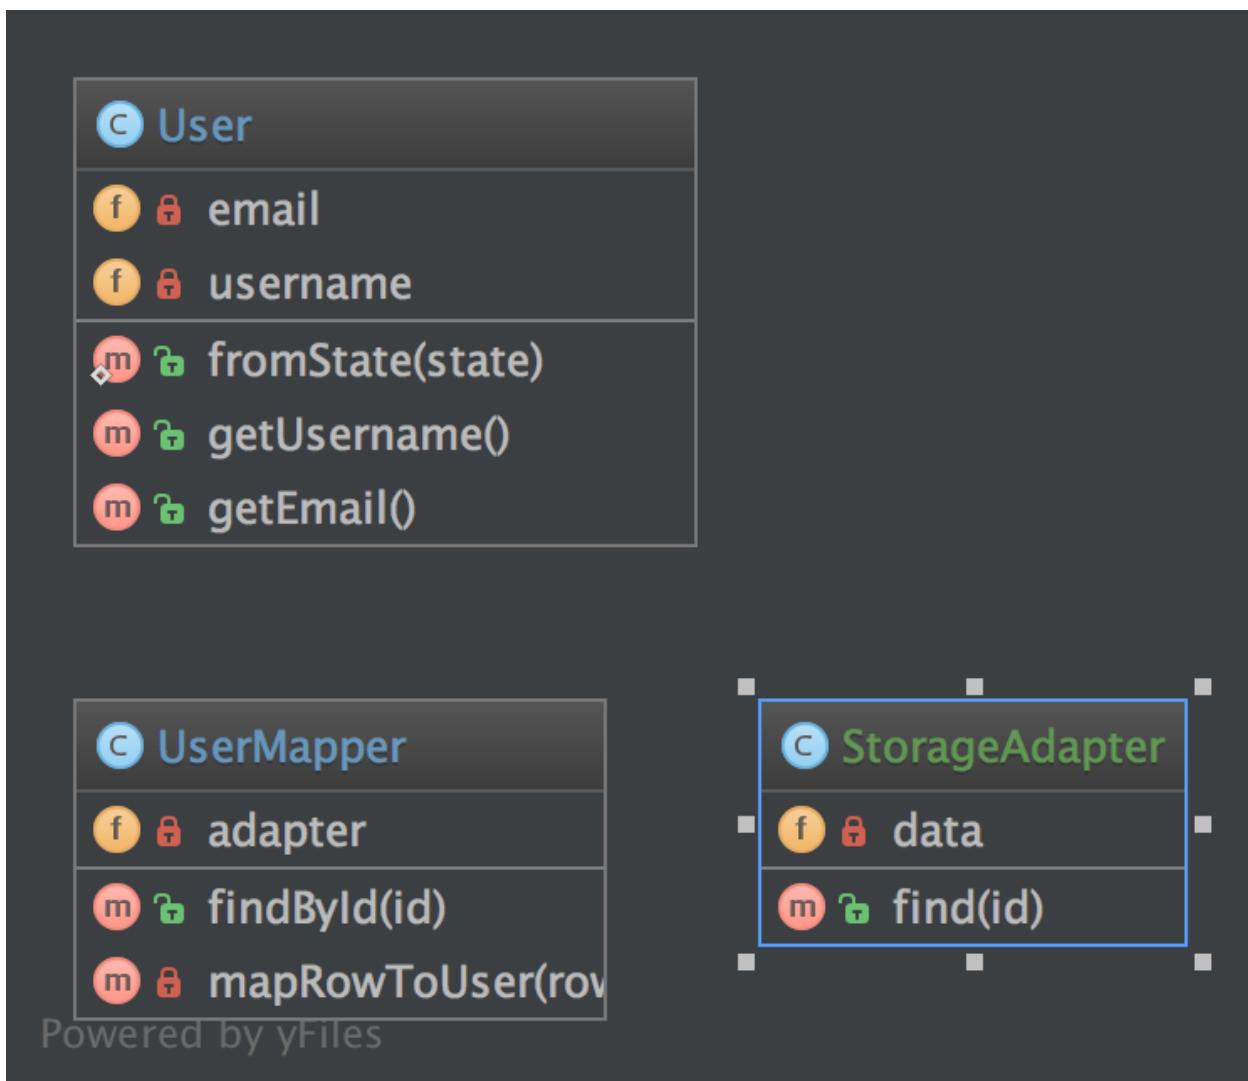

A Data Mapper, is a Data Access Layer that performs bidirectional transfer of data between a persistent data store (often a relational database) and an in memory data representation (the domain layer). The goal of the pattern is to keep the in memory representation and the persistent data store independent of each other and the data mapper itself. The layer is composed of one or more mappers (or Data Access Objects), performing the data transfer. Mapper implementations vary in scope. Generic mappers will handle many different domain entity types, dedicated mappers will handle one or a few.

The key point of this pattern is, unlike Active Record pattern, the data model follows Single Responsibility Principle.

Examples

- DB Object Relational Mapper (ORM) : Doctrine2 uses DAO named as “EntityRepository”

37     $this->assertSame('double room with wifi with extra bed', $booking->
38     getDescription());
39 }
40 }
```

1.2.6 Dependency Injection

Purpose

To implement a loosely coupled architecture in order to get better testable, maintainable and extendable code.

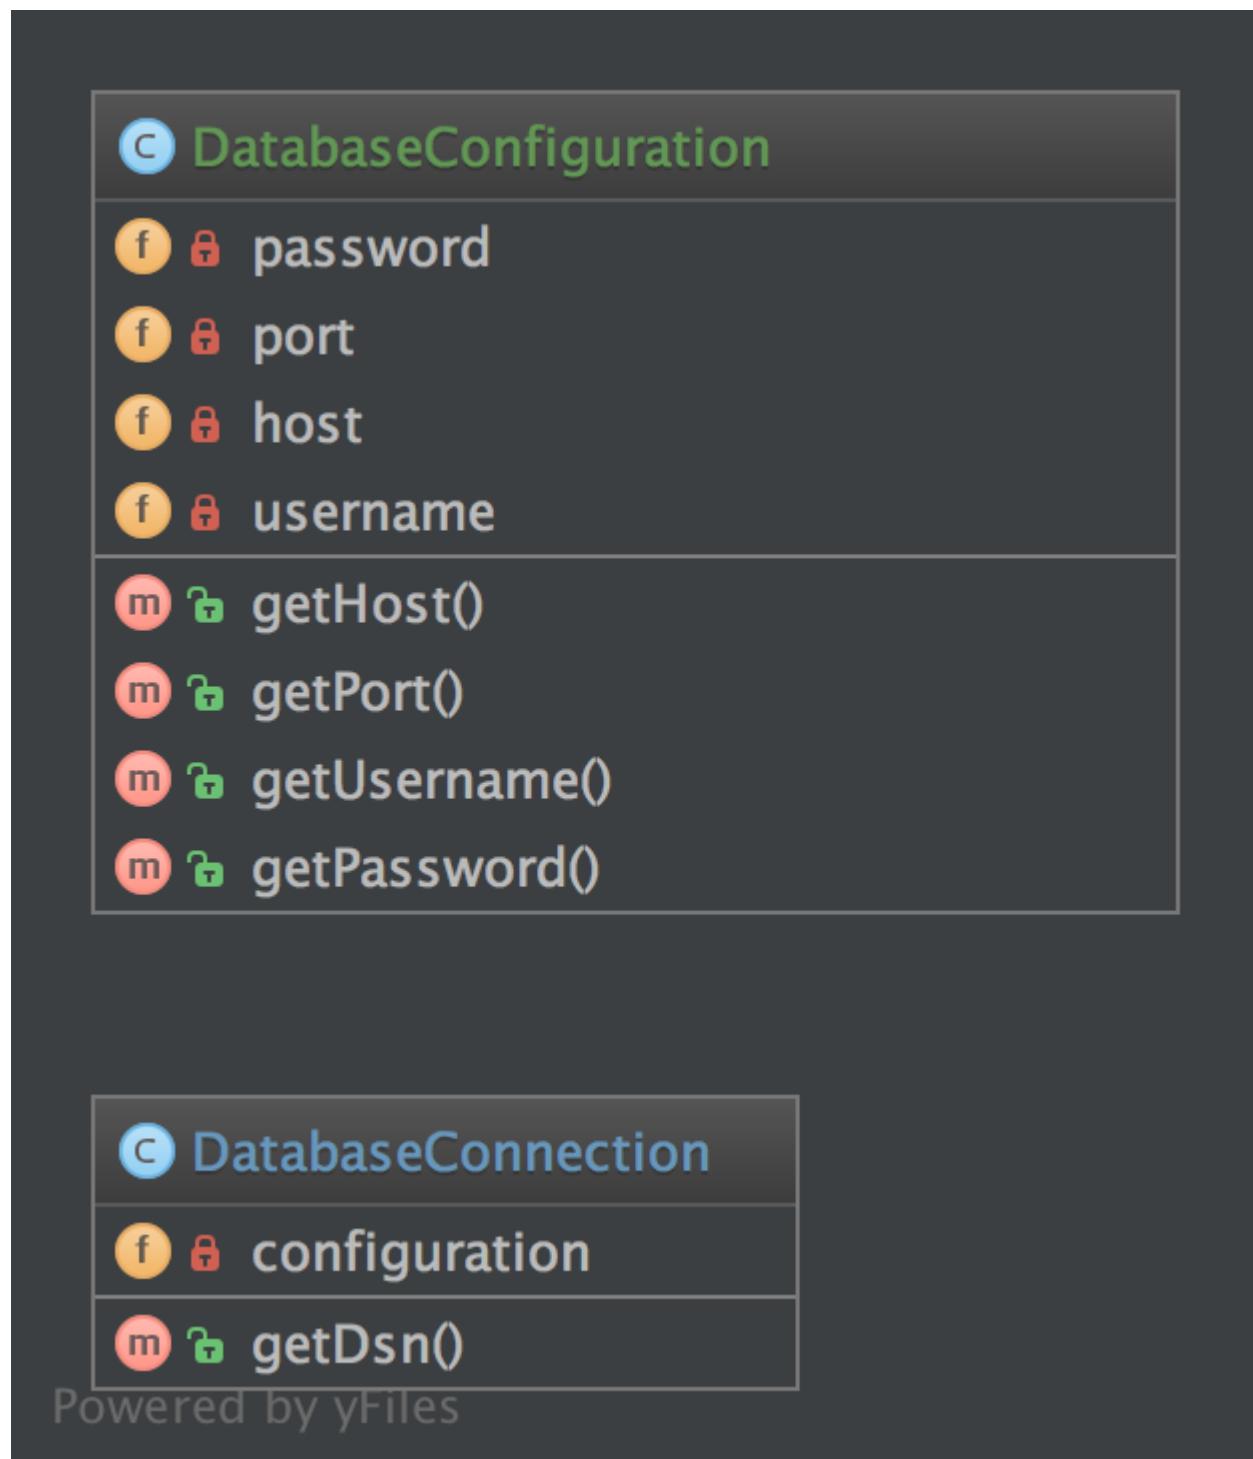

Usage

DatabaseConfiguration gets injected and DatabaseConnection will get all that it needs from \$config. Without DI, the configuration would be created directly in DatabaseConnection, which is not very good for testing and extending it.

Examples

- The Doctrine2 ORM uses dependency injection e.g. for configuration that is injected into a Connection object. For testing purposes, one can easily create a mock object of the configuration and inject that into the Connection object
- many frameworks already have containers for DI that create objects via a configuration array and inject them where needed (i.e. in Controllers)

UML Diagram

Code

16         $connection = new DatabaseConnection($config);
17
18         $this->assertSame('user:1234@localhost:3306', $connection->getDsn());
19     }
20 }
```

1.2.7 Facade

Purpose

The primary goal of a Facade Pattern is not to avoid you having to read the manual of a complex API. It's only a side-effect. The first goal is to reduce coupling and follow the Law of Demeter.

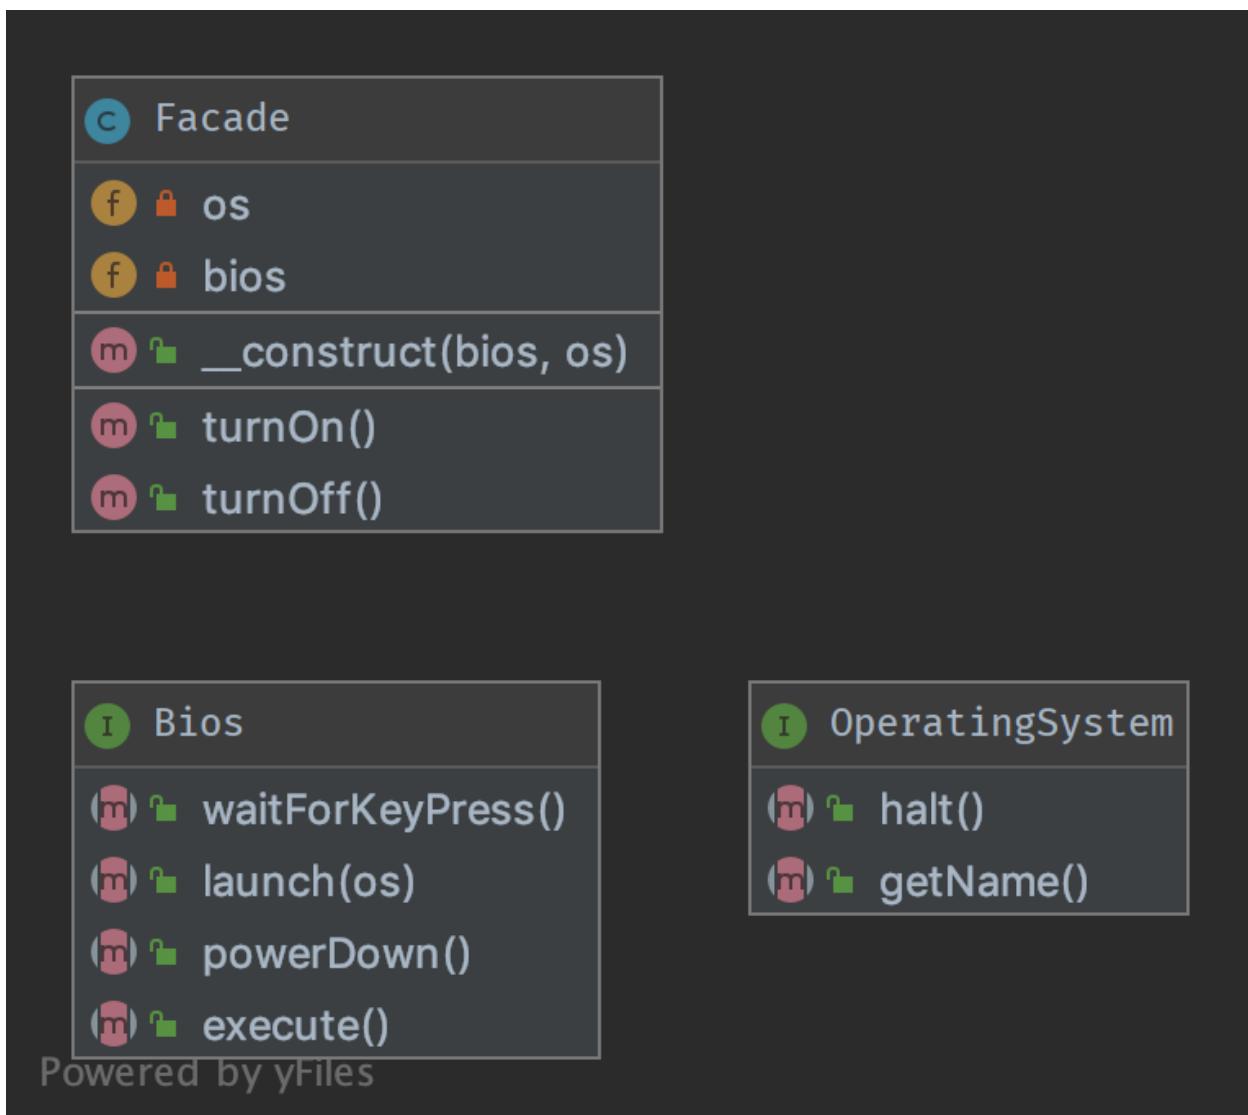

A Facade is meant to decouple a client and a sub-system by embedding many (but sometimes just one) interface, and of course to reduce complexity.

- A facade does not forbid you the access to the sub-system
- You can (you should) have multiple facades for one sub-system

That's why a good facade has no `new` in it. If there are multiple creations for each method, it is not a Facade, it's a Builder or a [Abstract|Static|Simple] Factory [Method].

The best facade has no `new` and a constructor with interface-type-hinted parameters. If you need creation of new instances, use a Factory as argument.

UML Diagram

Code

9 use DesignPatterns\Structural\Facade\OperatingSystem;
10 use PHPUnit\Framework\TestCase;
11
12 class FacadeTest extends TestCase
13 {
14     public function testComputerOn()
15     {
16         $os = $this->createMock(OperatingSystem::class);
17
18         $os->method('getName')
19             ->will($this->returnValue('Linux'));
20
21         $bios = $this->createMock(Bios::class);
22
23         $bios->method('launch')
24             ->with($os);
25
26         /** @noinspection PhpParamsInspection */
27         $facade = new Facade($bios, $os);
28         $facade->turnOn();
29
30         $this->assertSame('Linux', $os->getName());
31     }
32 }
```

1.2.8 Fluent Interface

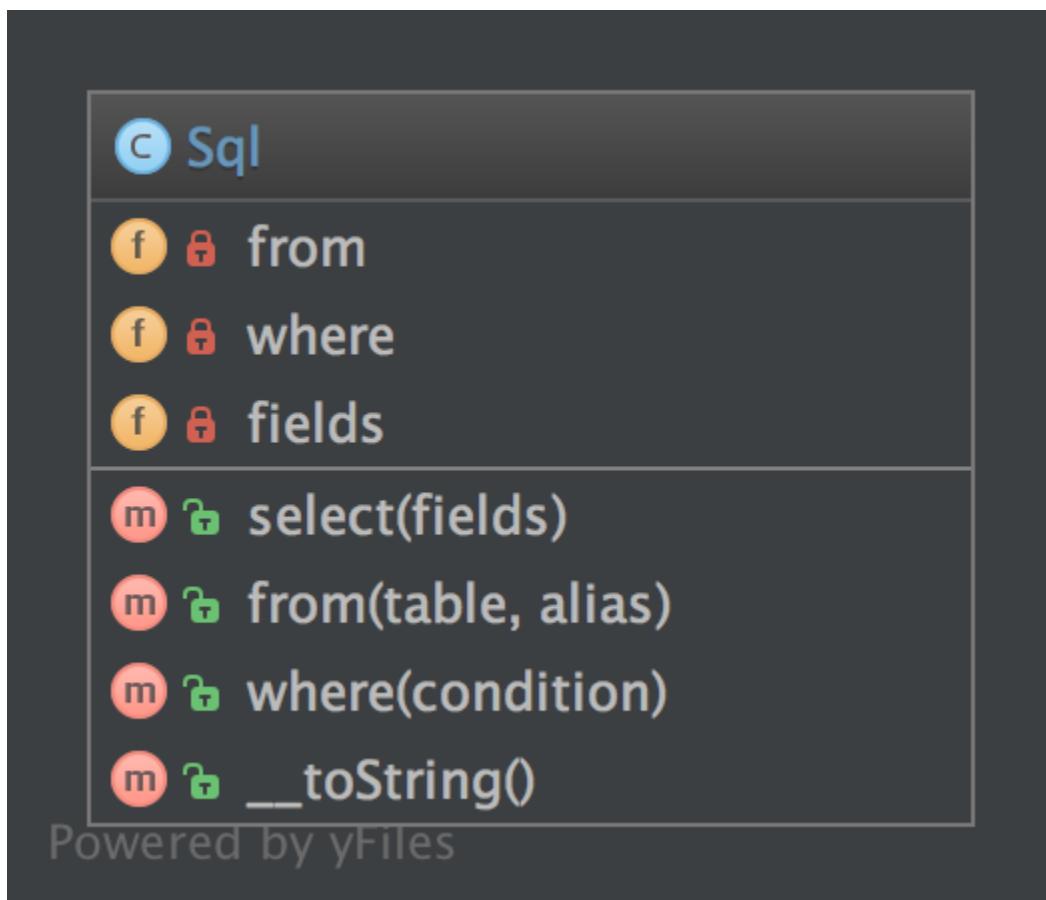

Purpose

To write code that is easy readable just like sentences in a natural language (like English).

Examples

- Doctrine2's QueryBuilder works something like that example class below
- PHPUnit uses fluent interfaces to build mock objects

UML Diagram

Code

You can also find this code on [GitHub](#)

`Sql.php`

```
1 <?php
2
3 declare(strict_types=1);
4
5 namespace DesignPatterns\Structural\FluentInterface;
6
7 class Sql implements \Stringable
8 {
9     private array $fields = [];
```

(continues on next page)

(continued from previous page)

```

10  private array $from = [];
11  private array $where = [];

12
13  public function select(array $fields): Sql
14  {
15      $this->fields = $fields;
16
17      return $this;
18  }

19
20  public function from(string $table, string $alias): Sql
21  {
22      $this->from[] = $table . ' AS ' . $alias;
23
24      return $this;
25  }

26
27  public function where(string $condition): Sql
28  {
29      $this->where[] = $condition;
30
31      return $this;
32  }

33
34  public function __toString(): string
35  {
36      return sprintf(
37          'SELECT %s FROM %s WHERE %s',
38          join(', ', $this->fields),
39          join(', ', $this->from),
40          join(' AND ', $this->where)
41      );
42  }
43 }
```

Test

Tests/FluentInterfaceTest.php

```

1 <?php
2
3 declare(strict_types=1);
4
5 namespace DesignPatterns\Structural\FluentInterface\Tests;
6
7 use DesignPatterns\Structural\FluentInterface\Sql;
8 use PHPUnit\Framework\TestCase;
9
10 class FluentInterfaceTest extends TestCase
11 {
12     public function testBuildSQL()
```

(continues on next page)

(continued from previous page)

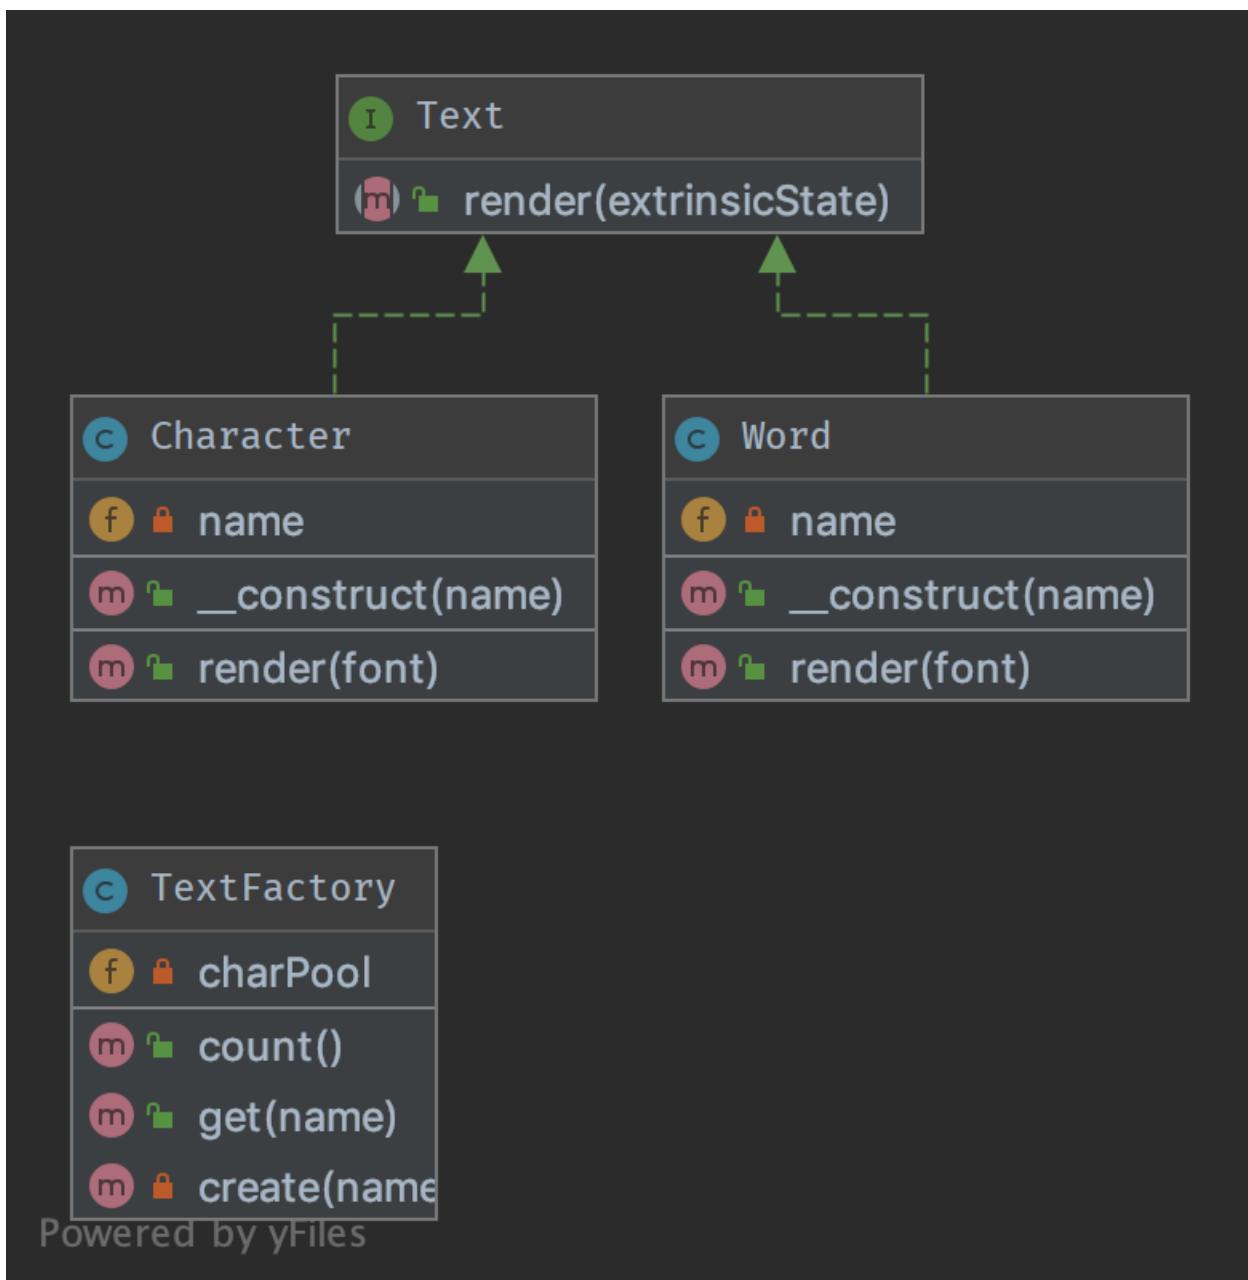

```
13  {
14      $query = (new Sql())
15          ->select(['foo', 'bar'])
16          ->from('foobar', 'f')
17          ->where('f.bar = ?');
18
19      $this->assertSame('SELECT foo, bar FROM foobar AS f WHERE f.bar = ?', (string)
20      $query);
21 }
```

1.2.9 Flyweight

Purpose

To minimise memory usage, a Flyweight shares as much as possible memory with similar objects. It is needed when a large amount of objects is used that don't differ much in state. A common practice is to hold state in external data structures and pass them to the flyweight object when needed.

}

1.2.10 Proxy

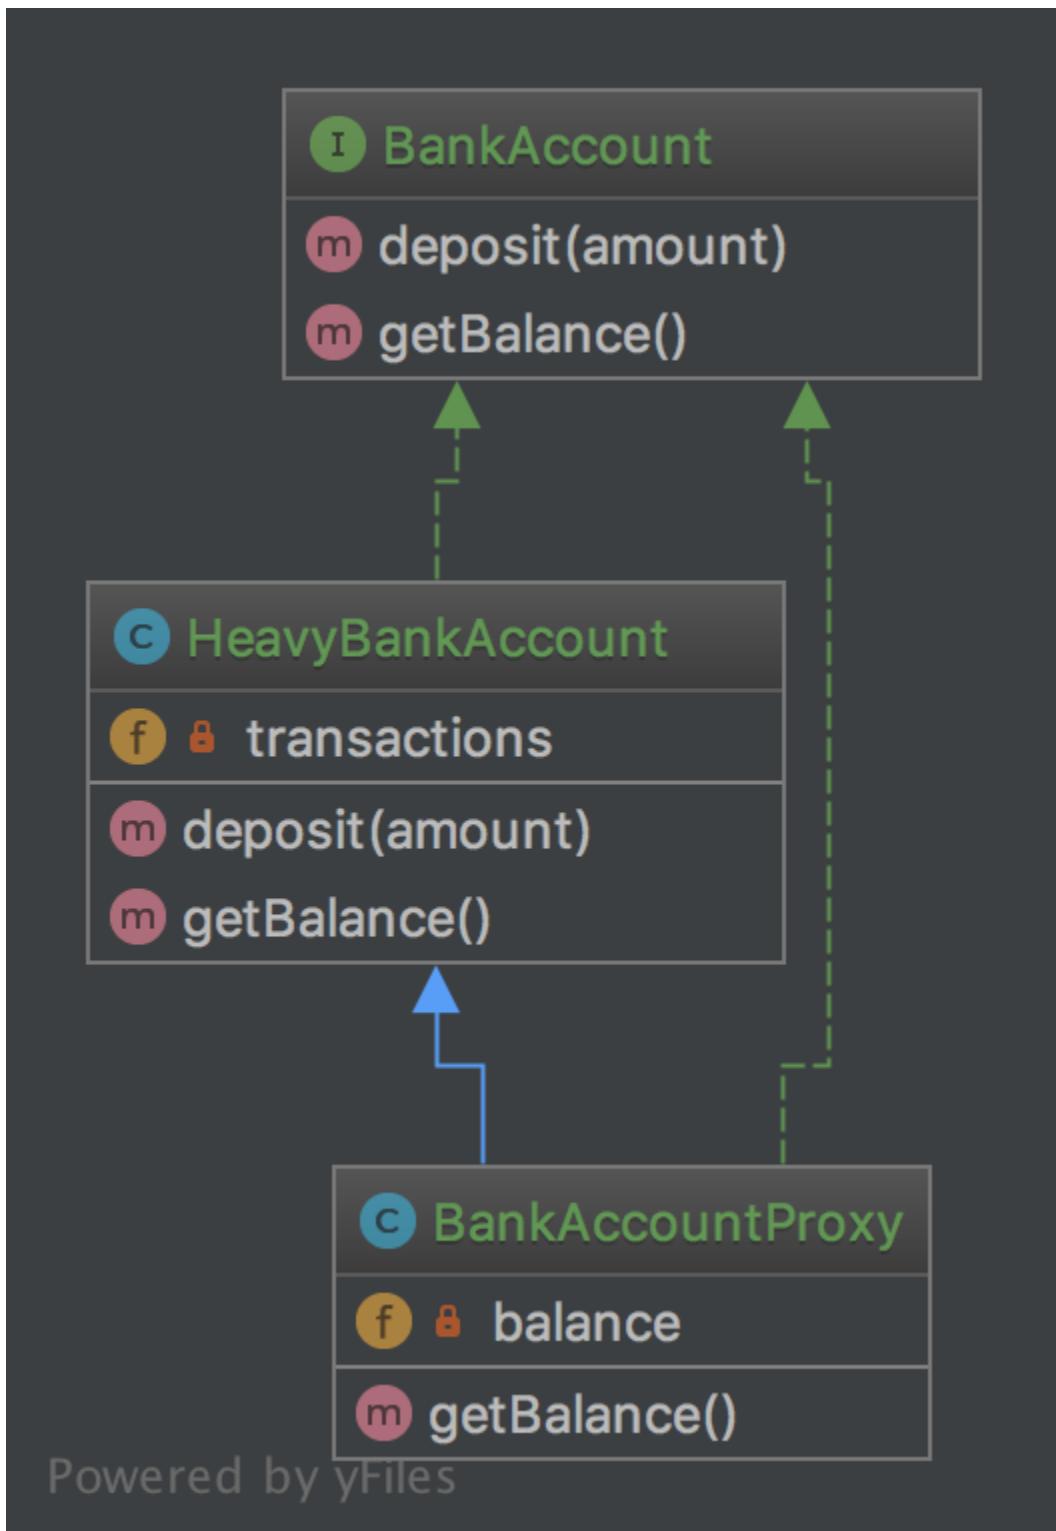

Purpose

To interface to anything that is expensive or impossible to duplicate.

Examples

- Doctrine2 uses proxies to implement framework magic (e.g. lazy initialization) in them, while the user still works with his own entity classes and will never use nor touch the proxies

UML Diagram

Code

```

1.2.11 Registry

Purpose

To implement a central storage for objects often used throughout the application, is typically implemented using an abstract class with only static methods (or using the Singleton pattern). Remember that this introduces global state, which should be avoided at all times! Instead implement it using Dependency Injection!

UML Diagram

Code

You can also find this code on [GitHub](#)

Registry.php

```

1 <?php
2

```

1.3 Behavioral

In software engineering, behavioral design patterns are design patterns that identify common communication patterns between objects and realize these patterns. By doing so, these patterns increase flexibility in carrying out this communication.

1.3.1 Chain Of Responsibilities

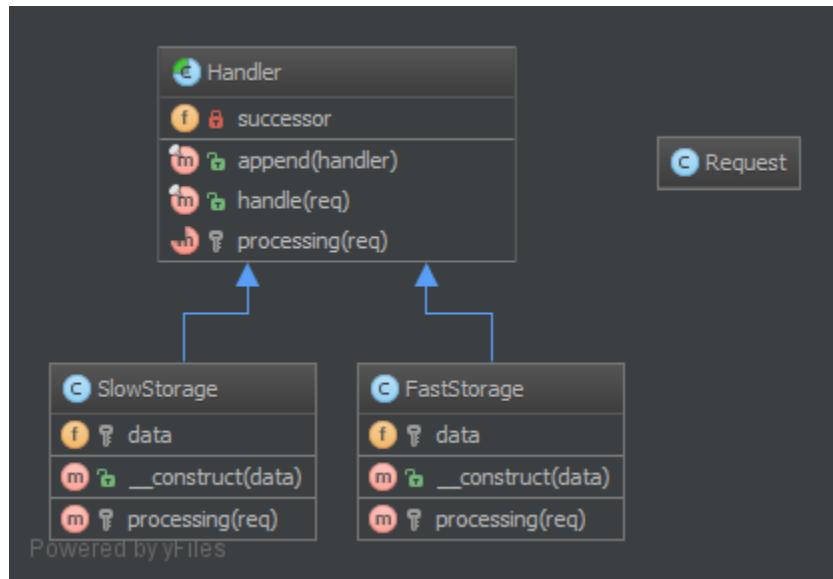

Purpose

To build a chain of objects to handle a call in sequential order. If one object cannot handle a call, it delegates the call to the next in the chain and so forth.

Examples

- logging framework, where each chain element decides autonomously what to do with a log message
- a Spam filter
- Caching: first object is an instance of e.g. a Memcached Interface, if that “misses” it delegates the call to the database interface

53 }
```

1.3.2 Command

Purpose

To encapsulate invocation and decoupling.

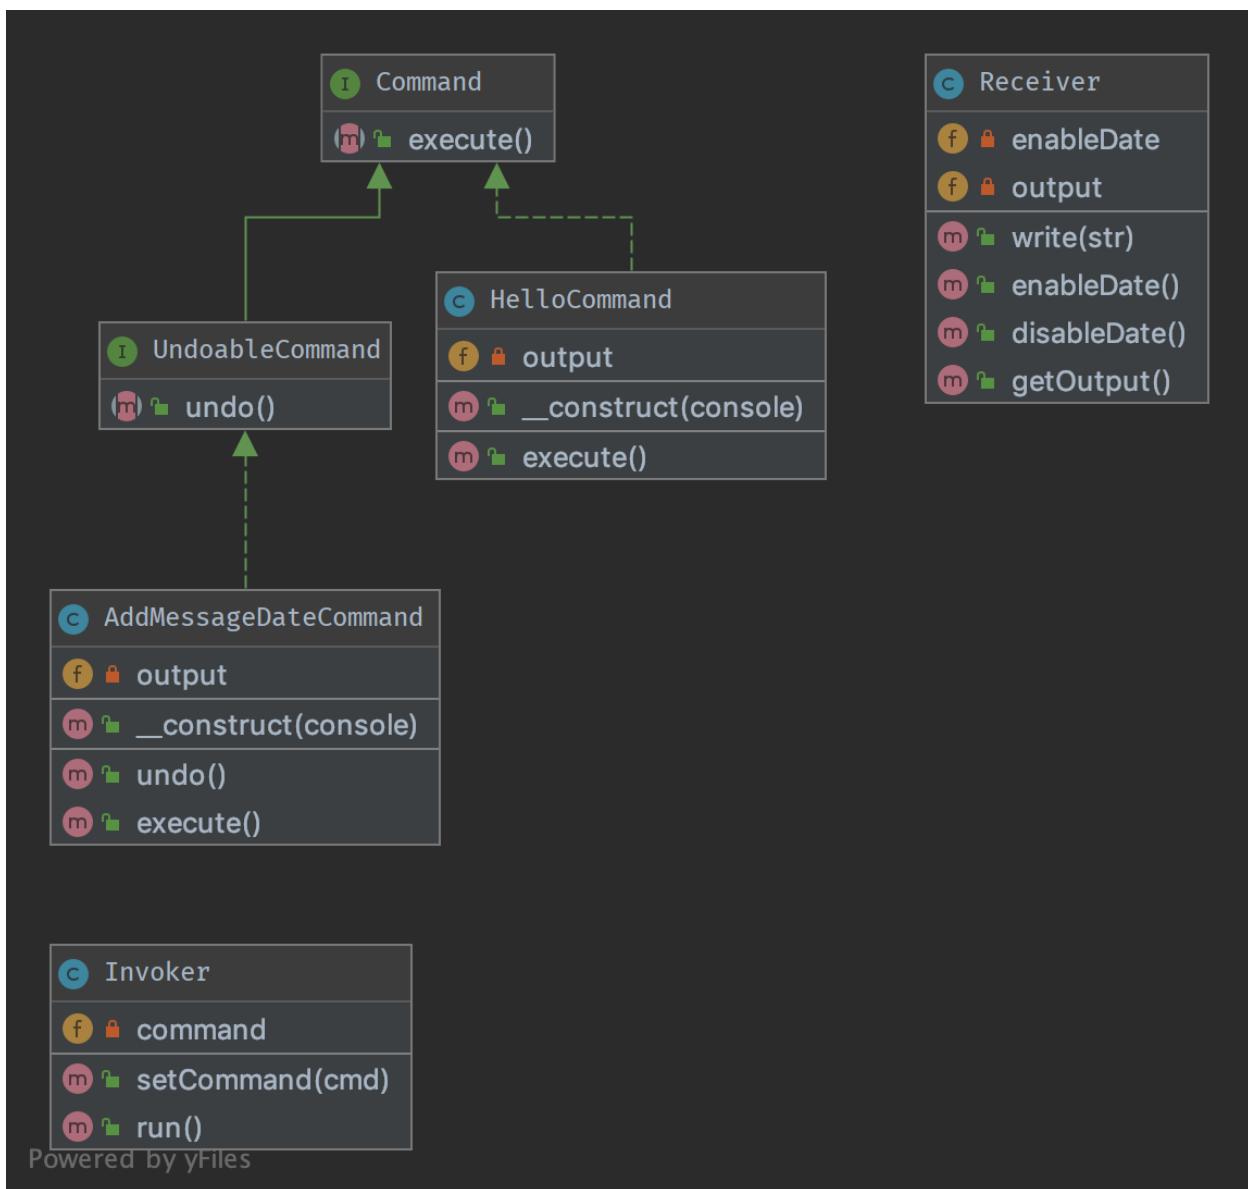

We have an Invoker and a Receiver. This pattern uses a “Command” to delegate the method call against the Receiver and presents the same method “execute”. Therefore, the Invoker just knows to call “execute” to process the Command of the client. The Receiver is decoupled from the Invoker.

The second aspect of this pattern is the undo(), which undoes the method execute(). Command can also be aggregated to combine more complex commands with minimum copy-paste and relying on composition over inheritance.

Examples

- A text editor : all events are commands which can be undone, stacked and saved.
- big CLI tools use subcommands to distribute various tasks and pack them in “modules”, each of these can be implemented with the Command pattern (e.g. vagrant)

```

1.3.3 Interpreter

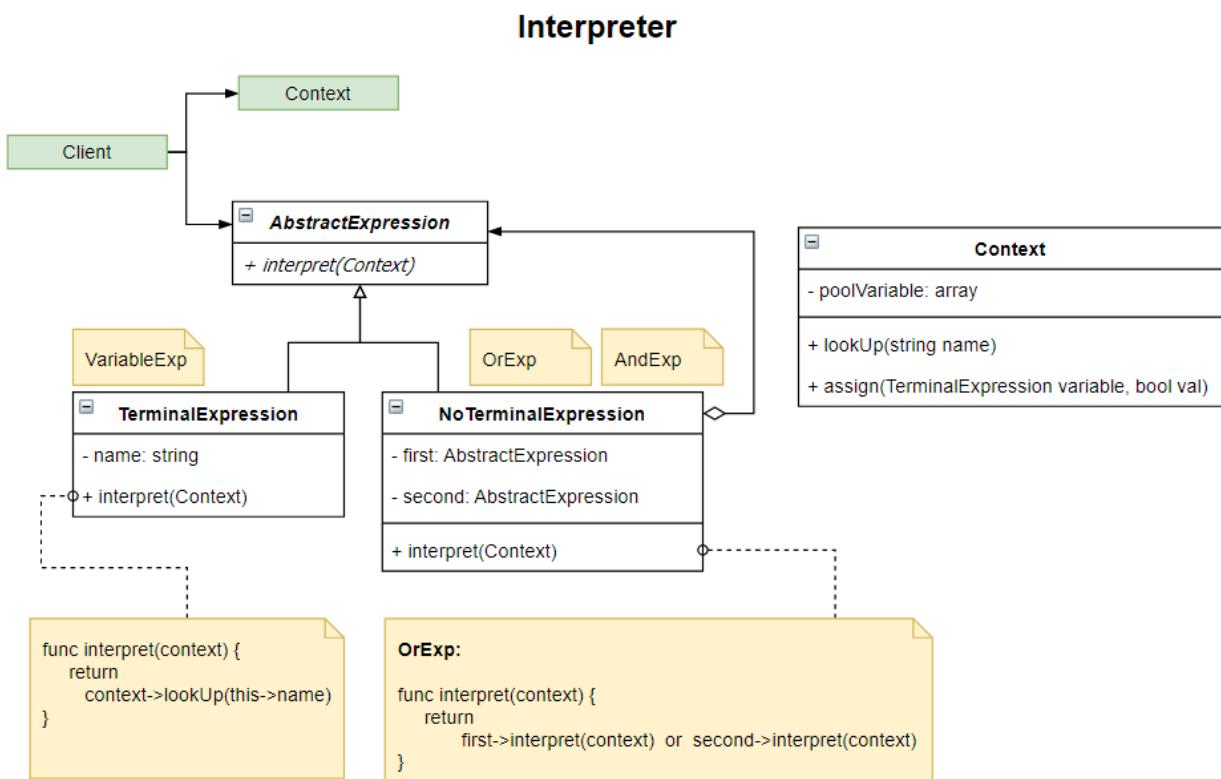

Purpose

For a given language, it defines the representation of its grammar as “No Terminal Expression” and “Terminal Expression”, as well as an interpreter for the sentences of that language.

Examples

- An example of a binary logic interpreter, each definition is defined by its own class

```

1.3.4 Iterator

Purpose

To make an object iterable and to make it appear like a collection of objects.

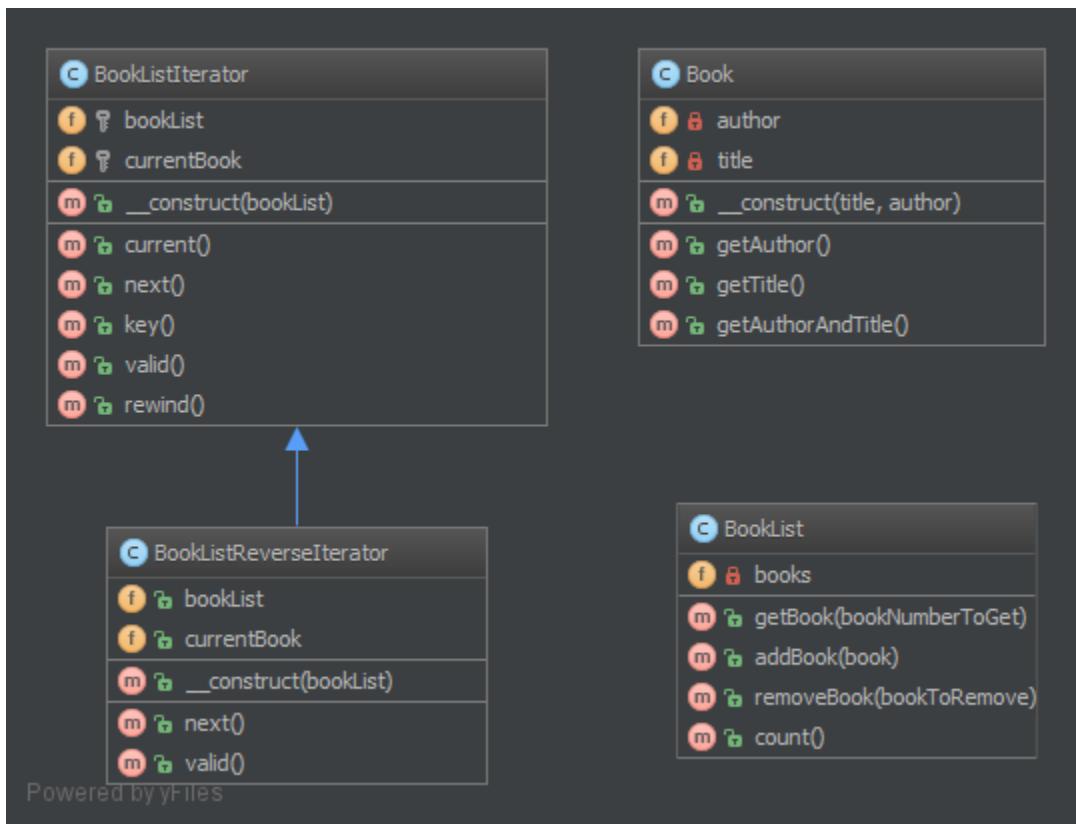

Examples

- to process a file line by line by just running over all lines (which have an object representation) for a file (which of course is an object, too)

Note

Standard PHP Library (SPL) defines an interface `Iterator` which is best suited for this! Often you would want to implement the `Countable` interface too, to allow `count($object)` on your iterable object

1.3.5 Mediator

Purpose

This pattern provides an easy way to decouple many components working together. It is a good alternative to Observer IF you have a “central intelligence”, like a controller (but not in the sense of the MVC).

All components (called Colleague) are only coupled to the Mediator interface and it is a good thing because in OOP, one good friend is better than many. This is the key-feature of this pattern.

19         $mediator->printInfoAbout('Dominik');
20     }
21 }
```

1.3.6 Memento

Purpose

It provides the ability to restore an object to its previous state (undo via rollback) or to gain access to state of the object, without revealing its implementation (i.e., the object is not required to have a function to return the current state).

The memento pattern is implemented with three objects: the Originator, a Caretaker and a Memento.

Memento – an object that *contains a concrete unique snapshot of state* of any object or resource: string, number, array, an instance of class and so on. The uniqueness in this case does not imply the prohibition existence of similar states in different snapshots. That means the state can be extracted as the independent clone. Any object stored in the Memento should be *a full copy of the original object rather than a reference* to the original object. The Memento object is a “opaque object” (the object that no one can or should change).

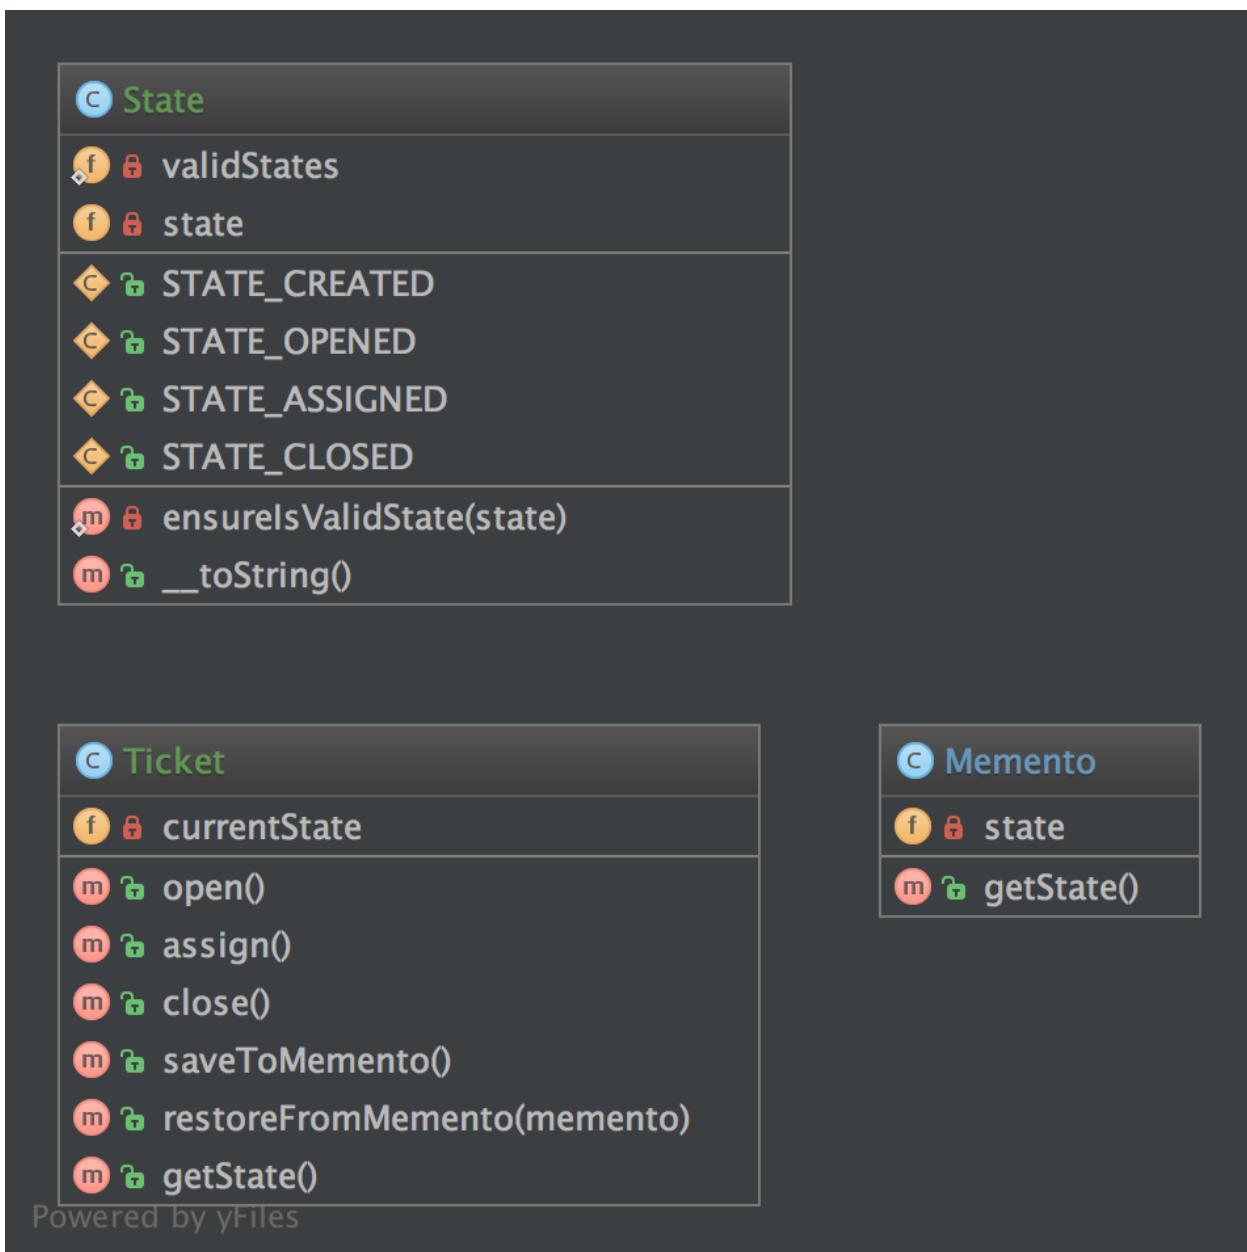

Originator – it is an object that contains the *actual state of an external object is strictly specified type*. Originator is able to create a unique copy of this state and return it wrapped in a Memento. The Originator does not know the history of changes. You can set a concrete state to Originator from the outside, which will be considered as actual. The Originator must make sure that given state corresponds the allowed type of object. Originator may (but not should) have any methods, but they *they can't make changes to the saved object state*.

Caretaker *controls the states history*. He may make changes to an object; take a decision to save the state of an external object in the Originator; ask from the Originator snapshot of the current state; or set the Originator state to equivalence with some snapshot from history.

Examples

- The seed of a pseudorandom number generator
- The state in a finite state machine
- Control for intermediate states of [ORM Model](#) before saving

```

1.3.7 Null Object

Purpose

NullObject is not a GoF design pattern but a schema which appears frequently enough to be considered a pattern. It has the following benefits:

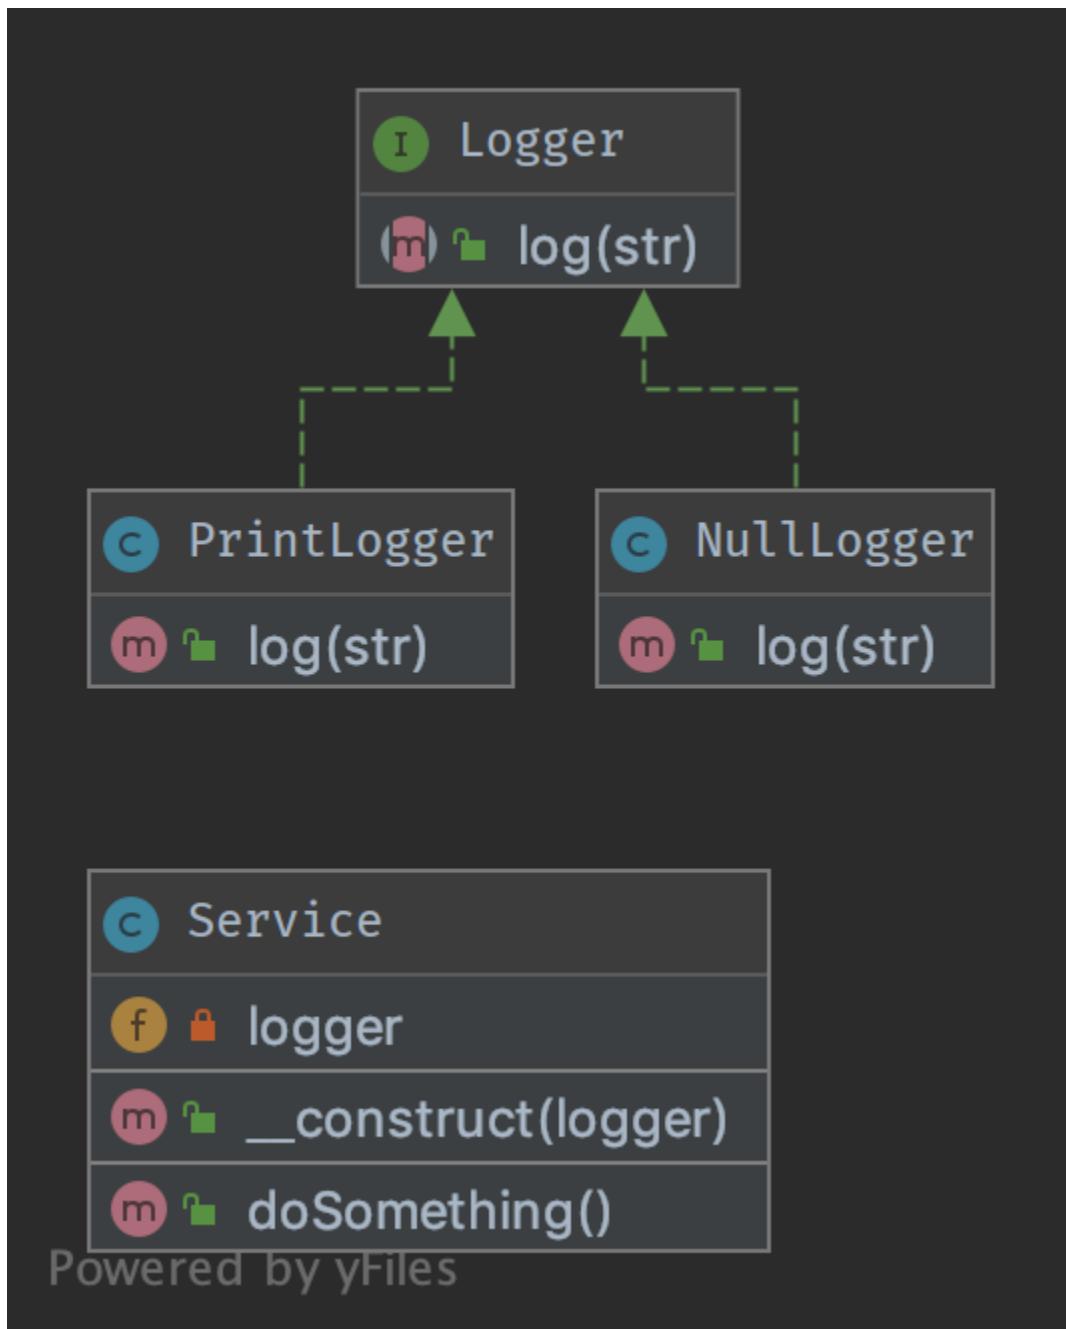

- Client code is simplified
- Reduces the chance of null pointer exceptions
- Fewer conditionals require less test cases

Methods that return an object or null should instead return an object or NullObject. NullObjects simplify boilerplate code such as `if (!is_null($obj)) { $obj->callSomething(); }` to just `$obj->callSomething();` by eliminating the conditional check in client code.

Examples

- Null logger or null output to preserve a standard way of interaction between objects, even if they shouldn't do anything
- null handler in a Chain of Responsibilities pattern
- null command in a Command pattern

1.3.8 Observer

Purpose

To implement a publish/subscribe behaviour to an object, whenever a “Subject” object changes its state, the attached “Observers” will be notified. It is used to shorten the amount of coupled objects and uses loose coupling instead.

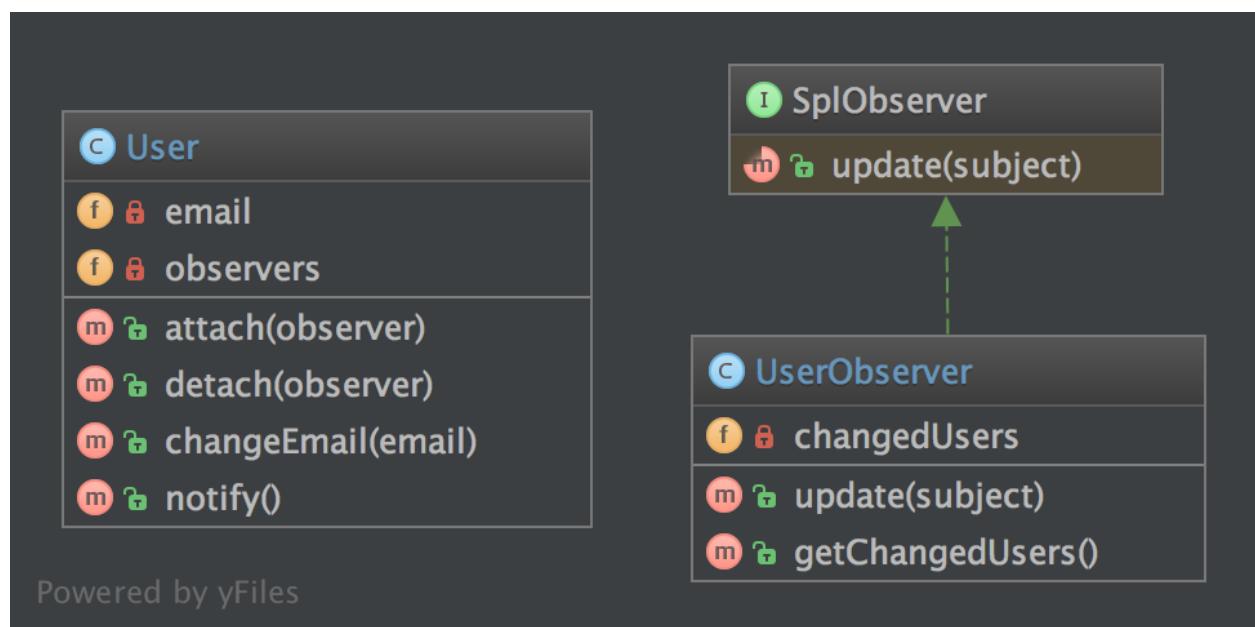

Examples

- a message queue system is observed to show the progress of a job in a GUI

Note

PHP already defines two interfaces that can help to implement this pattern: `SplObserver` and `SplSubject`.

21         $this->assertCount(1, $observer->getChangedUsers());
22     }
23 }

```

1.3.9 Specification

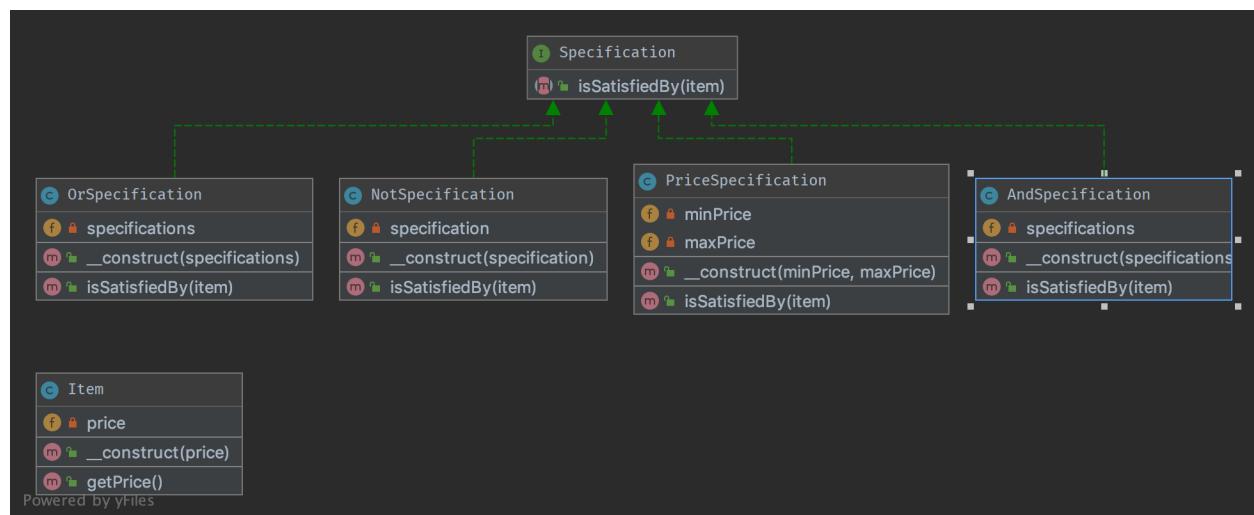

Purpose

Builds a clear specification of business rules, where objects can be checked against. The composite specification class has one method called `isSatisfiedBy` that returns either true or false depending on whether the given object satisfies the specification.

Examples

- RulerZ

```

1.3.10 State

Purpose

Encapsulate varying behavior for the same routine based on an object's state. This can be a cleaner way for an object to change its behavior at runtime without resorting to large monolithic conditional statements.

Terminology:

- Context
- Strategy
- Concrete Strategy

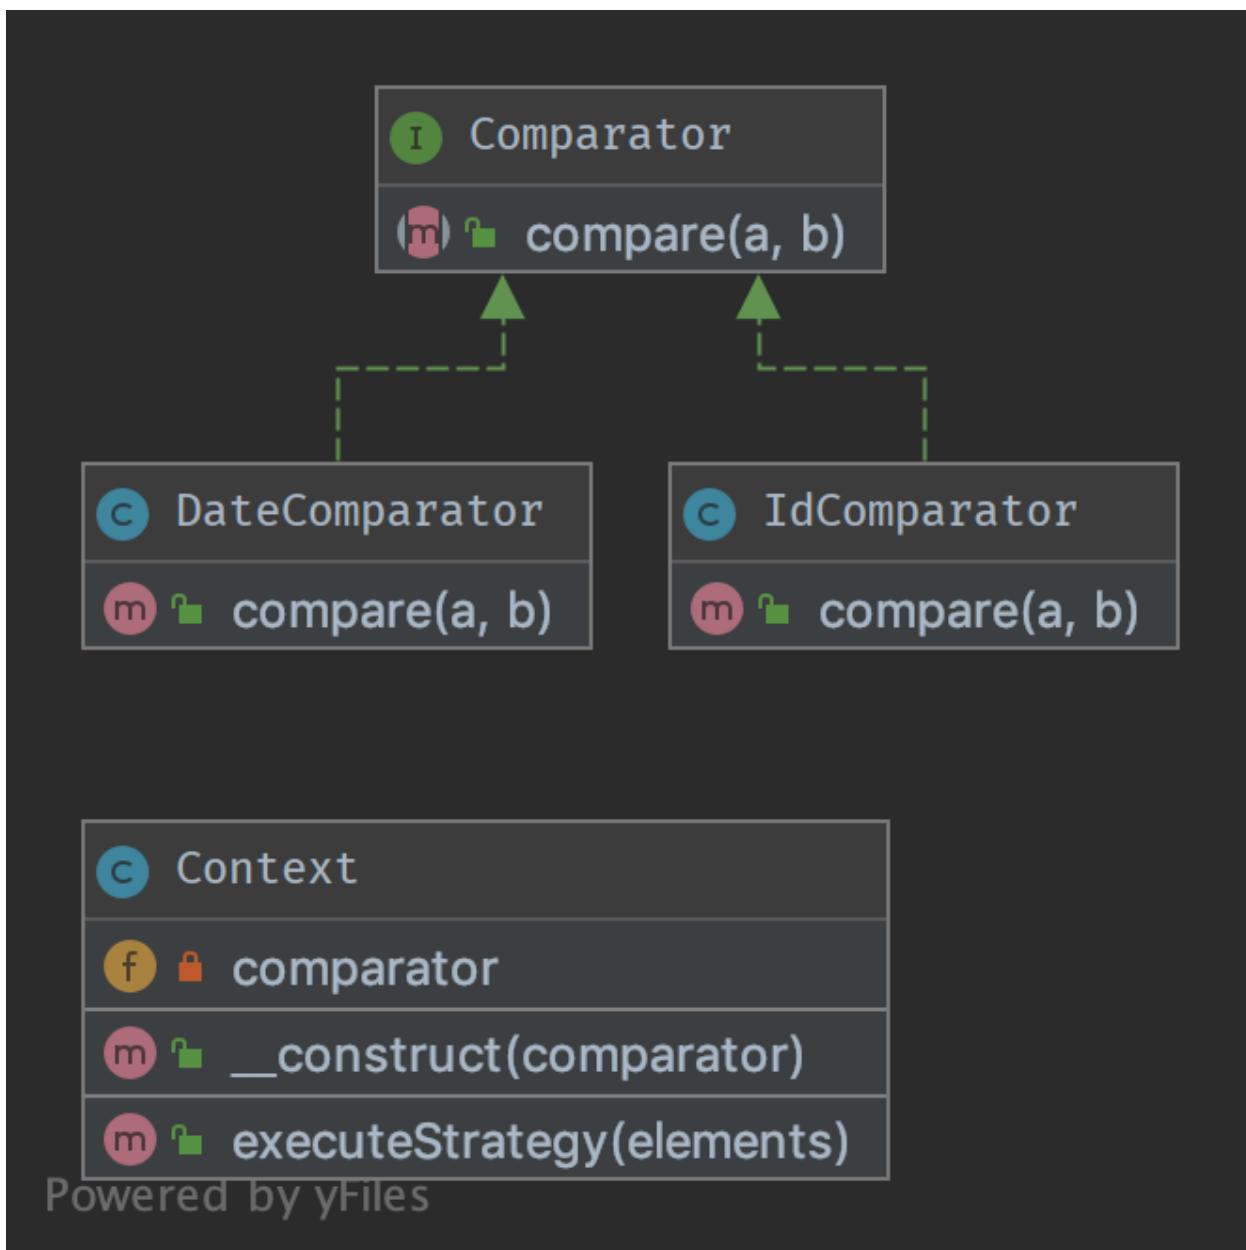

Purpose

To separate strategies and to enable fast switching between them. Also this pattern is a good alternative to inheritance (instead of having an abstract class that is extended).

Examples

- sorting a list of objects, one strategy by date, the other by id
- simplify unit testing: e.g. switching between file and in-memory storage

1.3.12 Template Method

Purpose

Template Method is a behavioral design pattern.

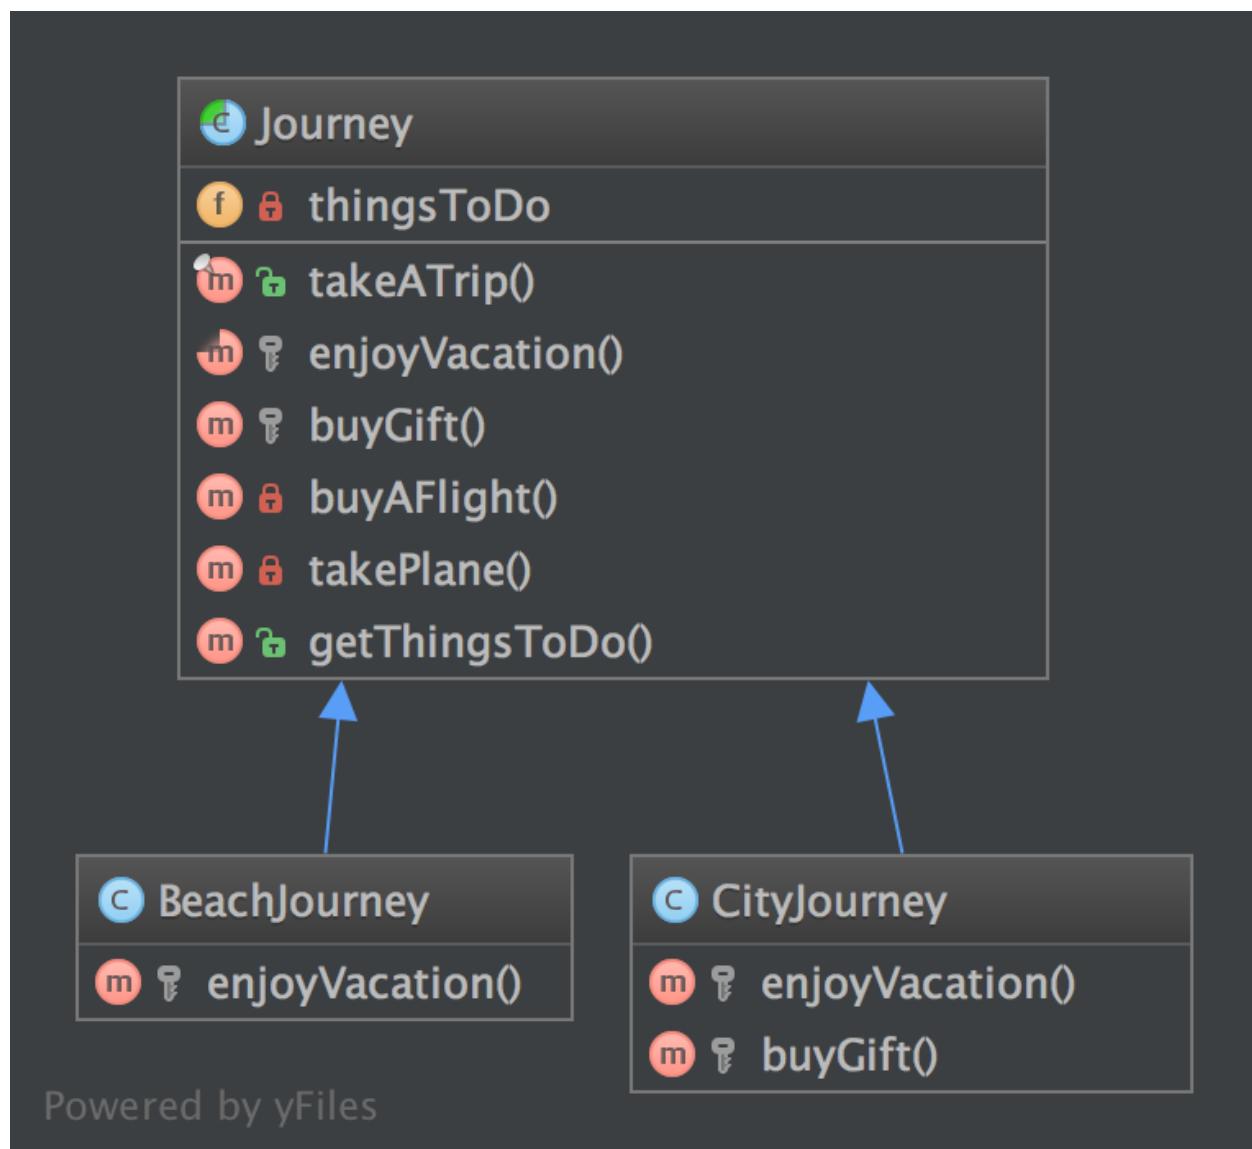

Perhaps you have encountered it many times already. The idea is to let subclasses of this abstract template “finish” the behavior of an algorithm.

A.k.a the “Hollywood principle”: “Don’t call us, we call you.” This class is not called by subclasses but the inverse. How? With abstraction of course.

In other words, this is a skeleton of algorithm, well-suited for framework libraries. The user has just to implement one method and the superclass do the job.

It is an easy way to decouple concrete classes and reduce copy-paste, that’s why you’ll find it everywhere.

        );
    }
}
```

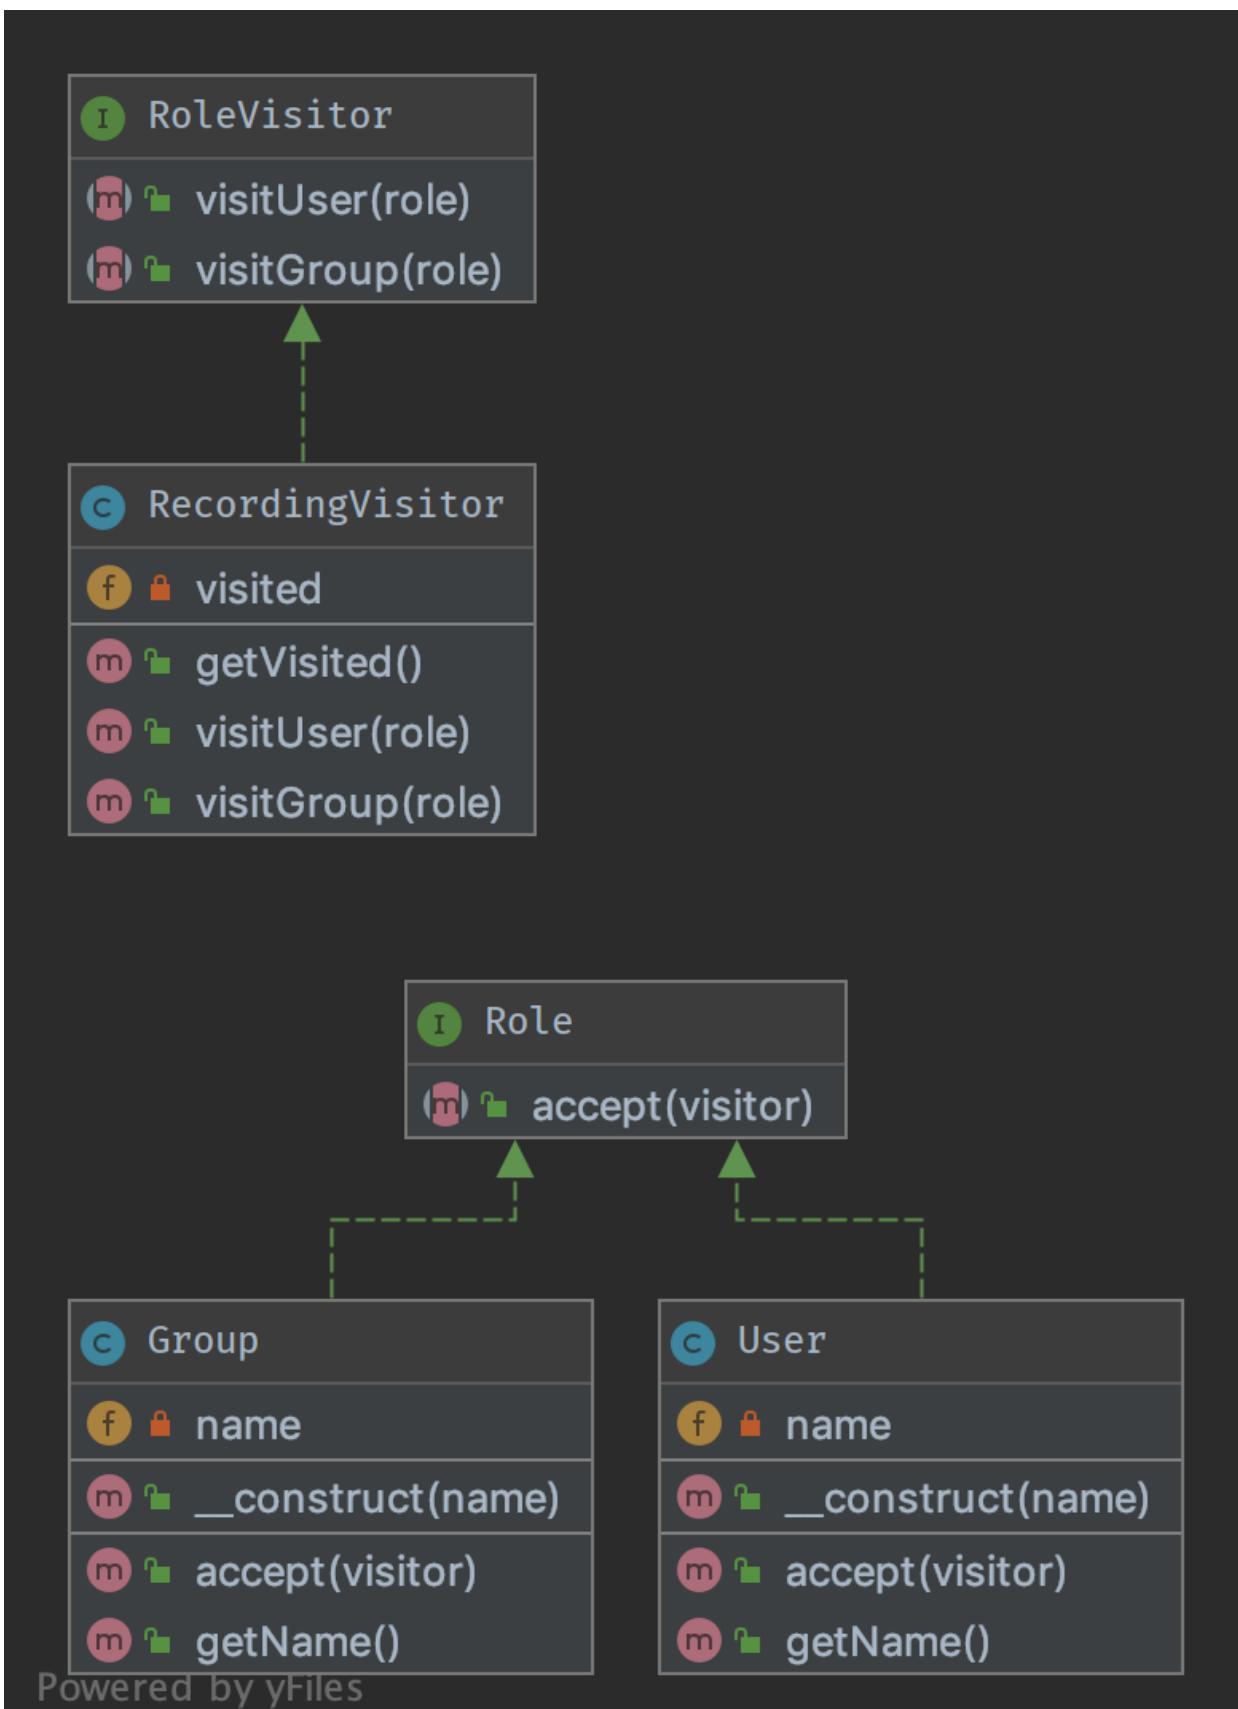

1.3.13 Visitor

Purpose

The Visitor Pattern lets you outsource operations on objects to other objects. The main reason to do this is to keep a separation of concerns. But classes have to define a contract to allow visitors (the `Role::accept` method in the example).

The contract is an abstract class but you can have also a clean interface. In that case, each Visitor has to choose itself which method to invoke on the visitor.

```

1.4 More

1.4.1 Service Locator

THIS IS CONSIDERED TO BE AN ANTI-PATTERN!

Service Locator is considered for some people an anti-pattern. It violates the Dependency Inversion principle. Service Locator hides class' dependencies instead of exposing them as you would do using the Dependency Injection. In case of changes of those dependencies you risk to break the functionality of classes which are using them, making your system difficult to maintain.

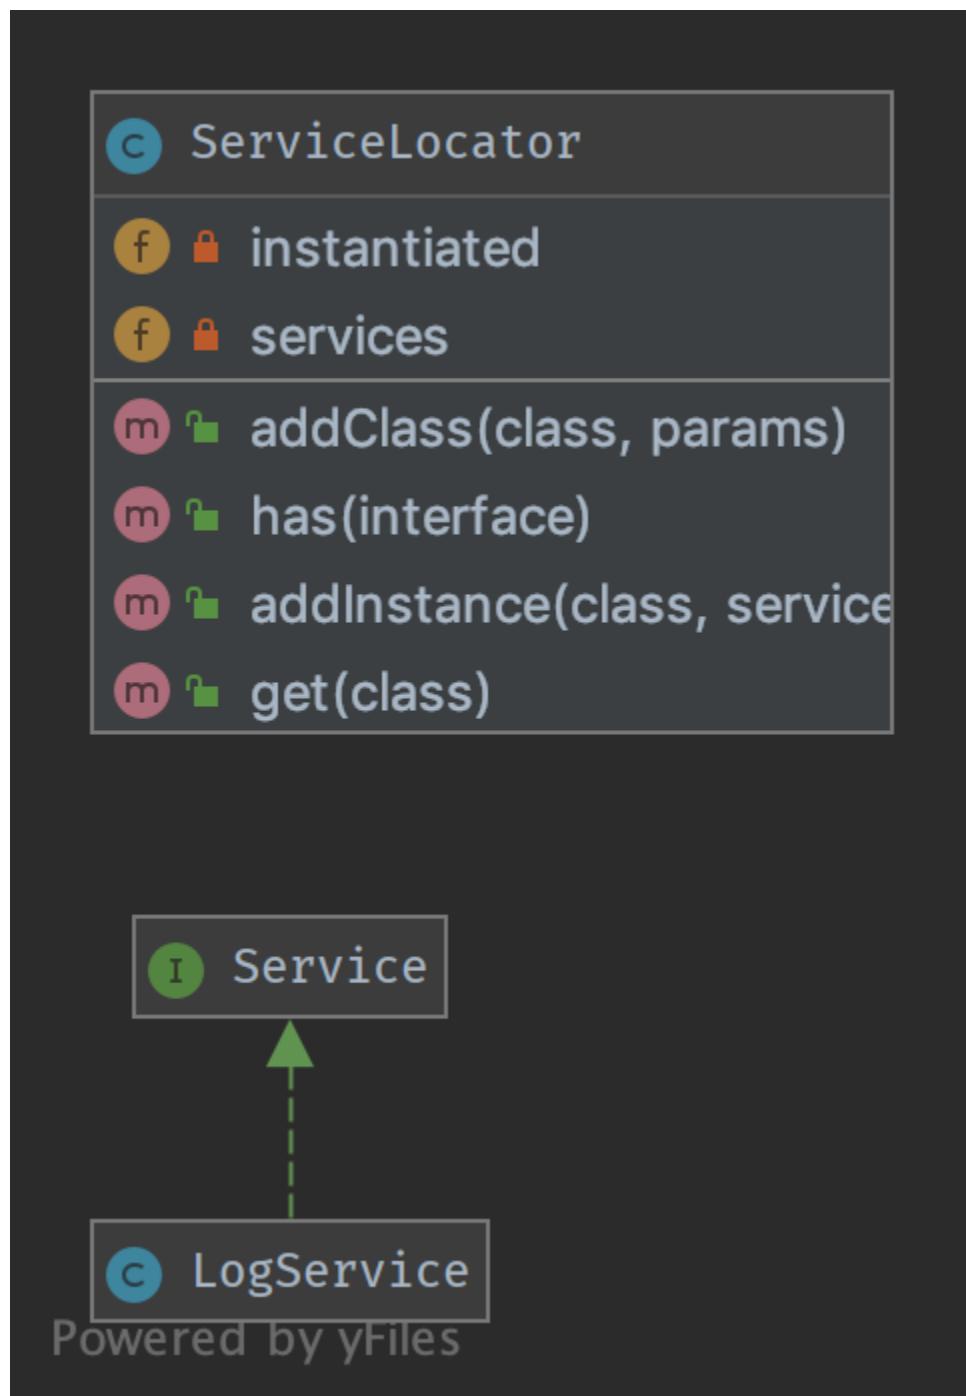

Purpose

To implement a loosely coupled architecture in order to get better testable, maintainable and extendable code. DI pattern and Service Locator pattern are an implementation of the Inverse of Control pattern.

Usage

With ServiceLocator you can register a service for a given interface. By using the interface you can retrieve the service and use it in the classes of the application without knowing its implementation. You can configure and inject the Service Locator object on bootstrap.

32
33         $this->assertInstanceOf(LogService::class, $logger);
34     }
35 }
```

1.4.2 Repository

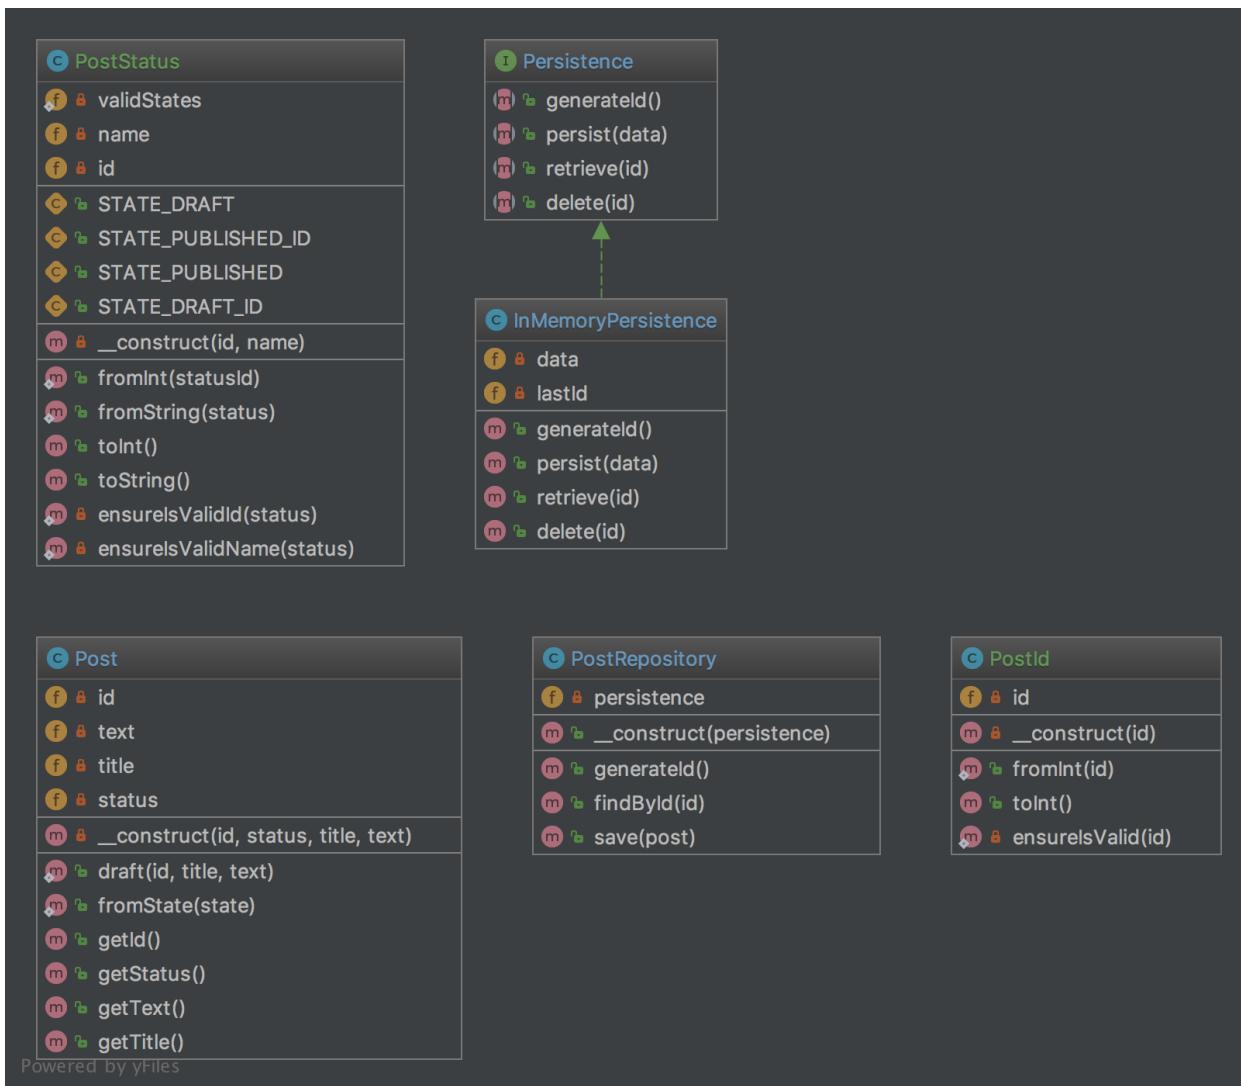

Purpose

Mediates between the domain and data mapping layers using a collection-like interface for accessing domain objects. Repository encapsulates the set of objects persisted in a data store and the operations performed over them, providing a more object-oriented view of the persistence layer. Repository also supports the objective of achieving a clean separation and one-way dependency between the domain and data mapping layers.

Examples

- Doctrine 2 ORM: there is Repository that mediates between Entity and DBAL and contains methods to retrieve objects
- Laravel Framework

1.4.3 Entity-Attribute-Value (EAV)

The Entity–attribute–value (EAV) pattern in order to implement EAV model with PHP.

Purpose

The Entity–attribute–value (EAV) model is a data model to describe entities where the number of attributes (properties, parameters) that can be used to describe them is potentially vast, but the number that will actually apply to a given entity is relatively modest.

UML Diagram

Code

You can also find this code on [GitHub](#)
